# 12610. RE: [FT100] Re: I have read everything from Eham, reflectors, to...

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-27 17:43:03 UTC
From: Cliff Bryant
Topic: 12587  Message: 12610

Ah! A very sensible suggestion. My arrived DOA in the box!! So I can't have modified it!!!!! The HF PA blew up after operation on 10m and 6m SSB. It was returned and repaired under warranty. I noticed that they had added more copper screening to bond to the lid. RF design problems anybody? The VHF/UHF output went QRP (currently being repaired) after prolonged operation driving around a scottish loch in the pitch black pouring rain - and that was last summer.. I've never carried out any modifications to the innards and the RF installation was solid with proper grounding to an ATAS (also grounded). I've had it over three years and it's a super little radio but be careful about cooling. My installation was under a front passenger seat with plenty of room around the vents. I'm a professional engineer so hopefully friends would testify that I know what I'm doing or at least have a fighting chance :-) I didn't even know about the preamp failures reported. The early messages reported HF and VHF/UHF PA failures. I've never had any audio problems but I use an external boom mic. You can see the circuit diagram for the interface in the pictures section of this group. 73 de Cliff, G4PZK -----Original Message----- From: Mike May Sent: Wed 2/27/2002 3:43 PM To: Cliff Bryant Cc: Subject: Re: [FT100] Re: I have read everything from Eham, reflectors, to... OK guys how about a poll right now instead of blindly saying that a large percentage of the FT100/D problems were caused by people modifying their radios. How many who had the blown V/U finals for instance #1. modified the radio themselves and #2 how many were just using it for casual operation or just receiving and then went to V/U tx and found the final FET had croaked. Mine had the fan mods and VSWR mods but still died and I wasn't even txing so to go and say that performing mods to the radio is the cause of most of the problems may not be correct. and #3 How many had out of box failures where the -9 volt converter died the 2nd day of ownership. #4 How many had the VHF/UHF pre-amp die even after the VSWR and fan mods had been performed. Mark me for number 2, 3 and 4. Mike WB8VLC/7 Bob Evans wrote: > Steve, > > I think you'll find that a large percentage (not all) of the guys who > have > had trouble with the FT-100 have either opened it up to "modify" it or > don't > have a clue what proper mobile, or fixed, installation techniques > include. > This list is an area to learn and share good operating practices, but > there > have been many mistakes made before they actually get on here and > blame the > radio for various failures (like it won't put out a full 250 watts > under > water on 11 meter AM ;-). Ah! A very sensible suggestion. My arrived DOA in the box!! So I can't have modified it!!!!! :-) The HF PA blew up after operation on 10m and 6m SSB. It was returned and repaired under warranty. I noticed that they had added more copper screening to bond to the lid. RF design problems anybody? The VHF/UHF output went QRP (currently being repaired) after prolonged operation driving around a scottish loch in the pitch black pouring rain - and that was last summer.. I've never carried out any modifications to the innards and the RF installation was solid with proper grounding to an ATAS (also grounded). I've had it over three years and it's a super little radio but be careful about cooling. My installation was under a front passenger seat with plenty of room around the vents. I'm a professional engineer so hopefully friends would testify that I know what I'm doing or at least have a fighting chance :-) I didn't even know about the preamp failures reported. The early messages reported HF and VHF/UHF PA failures. I've never had any audio problems but I use an external boom mic. You can see the circuit diagram for the interface in the pictures section of this group. 73 de Cliff, G4PZK -----Original Message----- From: Mike May Sent: Wed 2/27/2002 3:43 PM To: Cliff Bryant Cc: Subject: Re: [FT100] Re: I have read everything from Eham, reflectors, to... OK guys how about a poll right now instead of blindly saying that a large percentage of the FT100/D problems were caused by people modifying their radios. How many who had the blown V/U finals for instance #1. modified the radio themselves and #2 how many were just using it for casual operation or just receiving and then went to V/U tx and found the final FET had croaked. Mine had the fan mods and VSWR mods but still died and I wasn't even txing so to go and say that performing mods to the radio is the cause of most of the problems may not be correct. and #3 How many had out of box failures where the -9 volt converter died the 2nd day of ownership. #4 How many had the VHF/UHF pre-amp die even after the VSWR and fan mods had been performed. Mark me for number 2, 3 and 4. Mike WB8VLC/7 Bob Evans wrote: > Steve, > > I think you'll find that a large percentage (not all) of the guys who > have > had trouble with the FT-100 have either opened it up to "modify" it or > don't > have a clue what proper mobile, or fixed, installation techniques > include. > This list is an area to learn and share good operating practices, but > there > have been many mistakes made before they actually get on here and > blame the > radio for various failures (like it won't put out a full 250 watts > under > water on 11 meter AM ;-). > Howard I don't just see a few of them I see a lot of them and they are the same problems and too many not to have some truth to them!!! I mean no offense but the biggest was is a overheating problem that requires a diode to be placed in the fan wire. I mean what is up with that. If the radio has a problem like that it should be fixed by Yaesu. If you cut and modify a radio under warranty, you know as well as I do you can kiss the warranty goodbye. I appreciate the feedback though but there has to be something to this for so many people to be having and reporting the same problems over and over. 73, Steve
>
Steve,
As probably the most vocal of the HAPPY FT 100 owners I would like to point out one little error in your statement above. It is the fact that a resistor NOT a diode needs to be placed parralell with one of the fan wire grounds. I alos would like to say that ther are ONLY 3 problems with the FT 100 that crop on a regular basis.

One is the lack of cycling of the fans on U/VHF RX. Remedy place a 50 ohm resistor in line on ONE fan wire ground to a ground. Fans will run on low all the time. No cutting, solder ect.

Problem 2. Spurious ocsillation on 10 mtrs. Remedy for this add one ground strap from an RF sheild to ground. This can be done by slodering a peice of braid to the RF sheild and running it to the screw in the center of the chassis between the 2 sections of the rig. Soldering nees to be done BUT no driling/cutting.

Problem 3 muffled or lousy audio in any mode. Remedy TURN THE FREAKIN PROcessor OFF!, or/and remove the baffle in the mic and punch out the 3rd hole in the face of the mic. In this case when returning the rig to Yaesu you do not have to send the mic in UNLESS you feel that the mic is part of the problem. So who would know?

I sent my rig in prior the warranty expiring for a check up. I would do this with any NEW rig I own. I sent it in moddified for the expanded RX/TX and nothing was said. Several of the "F" menu options were changed from the factory setting as well and again nothing was said. I had had to resolder the external speaker jacks ground back to the board, that required that I remove the (or nearly so) the board that is mounted to from the rig to get to it and do it right. I put that in the note I wrote to Service and again nothing was said. I would imagine, based on my experience with Yaesu Service, that all of these warranty voiding issues are less then a worry.

You would see alot less of the crying about trouble with the FT 100 If everyone would follow Lee's directions and read the FAQ first before posting to the group.

I believe that someone else has already pointed this out to you but I would buy the 706 if I were you. Loose that address to this group and don't worry about all of the hundreds of people who not only are happy with their FT 100's but live comfortably in the knowledge that they can hear every QSO they are involved with due to the FT 100's superior rejection capabilities whether through the better DSP, the IF Shift, or the actually working adjustable Noise Blanker. They also know that they have better/wider RX/TX capabilities in the event of an emergency or for casual scanning, or the ability to use tone squelch in the "D" model (not even an option for the 706 by the way). If audio is the issue remember that with the 706 you have to have an in line preamplifier for any mic other then the stock hand mic due to its lack of audio. They also know how easy the menu is to get around and single button short cuts to often used adjustments, and that anybody could sit down and have a good idea of what each menu item is what as they go through the function menu and not have to guess as with the 706.

I would buy the 706 for its ability to be used with CAT and have more functions to use via this mode so that way I wouldn't have to touch the rig at all. So if this is the most important feature in buying a new rig then by all means buy the 706 and see how much help or support you will get from the 706 users group here on Yahoo. By the way what problems are there with the 706 do you know, do you know the remedies for them if there are? I have heard of several, lets say more then 3, but next to nothing as to remedies. At least with the 100 you know them and how to fix them if need be.

So in conclusion I guess my favorite saying about my FT 100 pretty much somes it up. " you couldn't give me 4 brand new IC 706 MK2G's for my battered and beaten up 2 year old FT 100 (NOT THE "D")" all I would do is take them straight to AES in Orlando and trade them in on 3 new FT 100D's and 3 AM filters for them. I wouldn't even bother to hook them up because I know the FT 100 is the better rig by far even and especially knowing the 2 small and easily fixed "problems".

73 all the best, and Please buy the 706 and loose the address to this group and let the 706 group pat you an the back for buying a deaf and dumb rig.

Forget the Yaesu connector. Get some 30A Anderson Powerpoles. Put them on your rig(s), your shack supply, your batteries, your battery combiner. Great little connector -- contacts are recessed and they're hermaphroditic so everything mates with everything. If you have long runs requiring real heavy gauge wire, don't worry about it -- just cut down the diameter at the end where it enters the contact by trimming off some strands before soldering. (Take care not to get solder on the business end of the contact.)
Mfgr: www.andersonpower.com.
www.powerwerx.com has red/black sets in ham quantities. Dunno abt int'l shipping.

# 12614. FT 100D FREQ MOD PROB SOLVED (maybe)

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-27 20:02:59 UTC
From: kg4fet
Topic: 12614  Message: 12614

OK for those of you trying to do the expanded RX/TX mod and failed this is for you. When entering the required frequecies into the display make sure you are using the 10 hz step NOT THE 5 HZ STEP! You will not be entering the correct freqency if you use the 5 hz step. Since the requecy resolution in the display does not go that low you would never know that you were of by 5 hz and the mod would fail. It just dawned on me when I posted to the FT 100 Bulletin Board on pluto.beseen.com, that I had done all 3 of the mods I had been involved with in one way or another the same way. In the CW mode, using the 10 hz step and then locking each freq in display so that even the slightest bump would not change the frequecy. If you are using the 5 hz step this really could be a probelm and you again never know it, and the mod would fail again. Try this and please let me know how that works. Email me at kg4fet@... if you succeed doing it this way. I will thne make sure all of the sites on the net that have the 100 mod on them are updated with this info and we will have a few more really happy FT 100 users!
73 guys and again please let me know if the mod works doing it using the 10 hz step

I had to count to ten before replying to your message. Take a minute and read it again and you may see why I am a bit offended. You implied that we may be using the rig on 11 meters and that we are causing the problems ourself's by going into it and that we don't know how to install a rig in a vehicle. Well, I beg to differ with you. We went into the rig because it had problems, not to make problems. I am pleased that you have had 20 months of use out of yours with no problems but I wouldn't attribute this to the fact that you are an expert at installing or that you were able to take yours apart to make an adjustment I have not found it necessary to make any adjustments in mine). My first one was a piece of junk and the second one is much better except for the poor reports I got on the audio. If I were you, I would consider myself to be very lucky and I hope that your good luck continues. No one has said that all FT-100's have problems, just some of them.

Steve,

I think you'll find that a large percentage (not all) of the guys who have had trouble with the FT-100 have either opened it up to "modify" it or don't have a clue what proper mobile, or fixed, installation techniques include. This list is an area to learn and share good operating practices, but there have been many mistakes made before they actually get on here and blame the radio for various failures (like it won't put out a full 250 watts under water on 11 meter AM ;-). I am one of many, many owners on this list that has had zero problems with my 20 month old FT-100 and have operated the pants off of it in HF CW/SSB contest, HF CW/SSB ragchewing, PSK31, RTTY, 6M CW/SSB and UHF/VHF FM ragchewing, both mobile and fixed. I've gotten great audio reports WITHOUT the need to poke out the guts of my microphone and my

CW note has always gotten good reports. I love the flexibility and features tucked into that tiny little box. I've only opened it up one time to adjust the CW sidetone. Is it 100% perfect...no, it is a piece of electronic equipment and can fail with or without abuse, however, if you operate it within the parameters that it was designed for, I think you'll find it to be an extremely worthwhile investment that will bring you many hours of enjoyment wherever you go.

Have fun with your decision!

Subject: I have read everything from Eham, reflectors, to...

the Yahoo groups and all I ever see is problems with this radio as in the FT100D. I love Yaesu gear and own the FT1000D for my HF station and was hoping to buy the FT100D with the ATLAS antenna system. But will the real radio stand up. I mean no offense to anyone who owns this radio but I see a lot more problems than pluses and even with the units after May 2001. Am I missing something or is this radio still having problems and users are just putting up with it and finding ways to modify the radio which voids the warranty!!! I mean every time I get a new post, there seems to be a new problem and gosh I don't want to buy an Icum and mean Icum 706 of any kind. Please guys help me out here and tell me the real truth, no matter how much it hurts, ooooooooohhhhhhhh and hi hi...LOL. 73, Steve
Have a great day, because if you don't someone else will!!!

I have used connectors may be Lucas for a number of years. In the late 70s and early 80s the local club standardised on Lucas automotive connectors (high current and very cheap). You can go to your local Lucas dealer and buy a handful of 25A connectors for not too much money.

# 12620. Passion, problems & my $0.02 ;-)

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-27 21:42:39 UTC
From: George Encarnacion
Topic: 12620  Message: 12620

I can appreciate how some are happy with, and passionate about their FT-100. I too, happen to think it's a radio with good features (even though I still have to get mine fixed.) I can also appreciate how some would feel after spending a bundle on the FT-100 and suffering one or more of these seemingly common faults or failures.

I don't think it's necessary to rub it in to people that are experiencing them and are just looking for help or ideas, nor belittle other radios or groups. Not everyone can do these mods to their radios either. And if I bought the radio new and found these problems ..... ? maybe I would be just as passionate in the negative sense.

What about the deaf RX problem? That's probably Problem No. 1 right now. No documented fix yet. $70+/hr bench time and 4-6 weeks to CA and then maybe a return trip to CA isn't for me.

Yaesu "lurks" here, probably got the ideas for some of their fixes from this group. They fix it and document it as an A0084XXXX, or the like on the invoice. My beef is, Yaesu should put out this info like another manufacturer does with their Service Bulletins. Or if they would like to have some deniability - "leak" the mod out.

I changed to the FT-100/ATAS-100 for the flexibility of the ATAS-100 antenna setup. PLUS - a better noise blanker, a good audio DSP band pass, and the ATAS. There are numerous Minuses but I can overlook them for the benefit of the ATAS system as I can't use large/long antennas.

I still have to do fan and hi-swr mods. Still need to troubleshoot (with circuit chiller) the cause of the thermally caused deaf RX. I don't know if the fan mod would prevent deaf RX aside from hopefully saving the V/U finals. I continue to use it even though I can't go on 10M. It's winter and I keep the car interior cool - it allows me to use the radio - although deaf RX sets in if I keep it on for long periods. BTW, my comments are in reference to my previous mobile installation - a 706MKII / LDG auto tuner and hamsticks.

Let's keep the ideas and information going.
Let's promote goodwill and common courtesy.
Let's enjoy our hobby.

73, George AH6BV / w1

# 12622. 2 Meter Mess

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-28 01:01:22 UTC
From: J. Morgan Ringold
Topic: 12621  Message: 12622

I currently have an FT-100D, ATAS-100 Antenna, and a Larson Factory Tuned 2 Meter Antenna. Purchased FT-100 in Dec and had high SWR probs on 20 & 40 meters. Returned to CA where it sat for 8 weeks. Just reinstalled last week. Now, SWR problem is gone on HF bands. However, now I have an SWR issue on 2 meter FM. Radio was connected to ATAS and noticed when working local repeater SWR icon came on and power dropped from 50W to about 20W. I still had the Larson factory tuned 2-meter antenna installed and knew it worked correctly when I had the FT-1500 installed (the week previous). Plugged 2/440 pigtail into Larson with same problem. However, I noted that during a single transmission the rig will display the High SWR icon and cut the power down. Then during the same transmission - without even unkeying the mic - the SWR icon will disappear and power goes back up. Keep in mind this happens with 2 separate antennas with 2 separate feed lines.

The only thing I can figure is that Yaesu has the SWR threshold set very low (for example 1.2 to 1) and maybe I'm somewhere between 1.19 to 1 and 1.21 to 1. I haven't yet checked the SWR but several months ago the Larson antenna reported good SWR and has always performed fine on the FT-1500.

At this point I'm at a loss. I plan to check the SWR this weekend on both antennas - but I am wondering - does anyone know what the actual SWR threshold for the FT-100D? Are there any other thoughts on what this could be?

Thanks much and Best 73,
de KG4PAN
Morgan

Morgan

In 20 years I have never seen a larson factory tuned antenna. Larson ships antennas for a band, it is up the buyer to tune the antenna for the proper frequency. I would check the tuning of the antenna.

However, I noted that during a single transmission the rig will display the High SWR icon and cut the power down. Then during the same transmission - without even unkeying the mic - the SWR icon will disappear and power goes back up. Keep in mind this happens with 2 separate antennas with 2 separate feed lines.

The only thing I can figure is that Yaesu has the SWR threshold set very low (for example 1.2 to 1) and maybe I'm somewhere between 1.19 to 1 and 1.21 to 1. I haven't yet checked the SWR but several months ago the Larson antenna reported good SWR and has always performed fine on the FT-1500.

At this point I'm at a loss. I plan to check the SWR this weekend on both antennas - but I am wondering - does anyone know what the actual SWR threshold for the FT-100D? Are there any other thoughts on what this could be?

Thanks much and Best 73,
de KG4PAN

Morgan

From: Steve Jones
Topic: 12595  Message: 12624

I have one response to you and your attack on me because I asked for good solid feedback and give me a break on the either a diode or resistor or whatever. You sound like someone that would take issue with anybody and everybody if they question the reliability of a product you own like it is family or something...it's just a piece of electronics, get a grip. Read my MSG, I don't like Icums and yes I mean Icums. I am a Yaesu fan, but I don't buy radio gear with my hard earned money if it has problems, the FT100D has problems, you know it, I know it and so do most people. They have just had to band aide them to make the radio work like it should from Yaesu to start with. If you don't like my post, you know how to hit the delete button don't you since you know how to fix all those problems with the FT100 so surely you can hit the delete button. This is America and this is a free country. If the person who moderates this group does not like how I responded to KG4FET then band me from the board. If this is the kind of crap you get for asking an honest and fair question, I don't need the hassle. 73 and thanks to those who were man enough respond like grown men instead of this guy who acted like I hurt his and his FT100D's feelings, hi hi LOL. 73, Steve

I mean no offense but the biggest was is a overheating problem that
requires a diode to be placed in the fan wire. I mean what is up with
that. If the radio has a problem like that it should be fixed by
Yaesu. If you cut and modify a radio under warranty, you know as well
as I do you can kiss the warranty goodbye. I appreciate the feedback
though but there has to be something to this for so many people to be
having and reporting the same problems over and over. 73, Steve
>
Steve,
As probably the most vocal of the HAPPY FT 100 owners I would like to
point out one little error in your statement above. It is the fact
that a resistor NOT a diode needs to be placed parralell with one of
the fan wire grounds. I alos would like to say that ther are ONLY 3
problems with the FT 100 that crop on a regular basis.

One is the lack of cycling of the fans on U/VHF RX. Remedy place a 50
ohm resistor in line on ONE fan wire ground to a ground. Fans will
run on low all the time. No cutting, solder ect.

Problem 2. Spurious ocsillation on 10 mtrs. Remedy for this add one
ground strap from an RF sheild to ground. This can be done by
slodering a peice of braid to the RF sheild and running it to the

screw in the center of the chassis between the 2 sections of the rig. Soldering nees to be done BUT no driling/cutting.

Problem 3 muffled or lousy audio in any mode. Remedy TURN THE FREAKIN PROcessor OFF!, or/and remove the baffle in the mic and punch out the 3rd hole in the face of the mic. In this case when returning the rig to Yaesu you do not have to send the mic in UNLESS you feel that the mic is part of the problem. So who would know?

I sent my rig in prior the warranty expiring for a check up. I would do this with any NEW rig I own. I sent it in moddified for the expanded RX/TX and nothing was said. Several of the "F" menu options were changed from the factory setting as well and again nothing was said. I had had to resolder the external speaker jacks ground back to the board, that required that I remove the (or nearly so) the board that is mounted to from the rig to get to it and do it right. I put that in the note I wrote to Service and again nothing was said. I would imagine, based on my experience with Yaesu Service, that all of these warranty voiding issues are less then a worry.

You would see alot less of the crying about trouble with the FT 100 If everyone would follow Lee's directions and read the FAQ first before posting to the group.

I believe that someone else has already pointed this out to you but I would buy the 706 if I were you. Loose that address to this group and don't worry about all of the hundreds of people who not only are happy with their FT 100's but live comfortably in the knowledge that they can hear every QSO they are involved with due to the FT 100's superior rejection capabilities whether through the better DSP, the IF Shift, or the actually working adjustable Noise Blanker. They also know that they have better/wider RX/TX capabilities in the event of an emergency or for casual scanning, or the ability to use tone squelch in the "D" model (not even an option for the 706 by the way). If audio is the issue remember that with the 706 you have to have an in line preamplifier for any mic other then the stock hand mic due to its lack of audio. They also know how easy the menu is to get around and single button short cuts to often used adjustments, and that anybody could sit down and have a good idea of what each menu item is what as they go through the function menu and not have to guess as with the 706.

I would buy the 706 for its ability to be used with CAT and have more functions to use via this mode so that way I wouldn't have to touch the rig at all. So if this is the most important feature in buying a new rig then by all means buy the 706 and see how much help or support you will get from the 706 users group here on Yahoo. By the way what problems are there with the 706 do you know, do you know the remedies for them if there are? I have heard of several, lets say more then 3, but next to nothing as to remedies. At least with the 100 you know them and how to fix them if need be.

So in conclusion I guess my favorite saying about my FT 100 pretty much somes it up. " you couldn't give me 4 brand new IC 706 MK2G's for my battered and beaten up 2 year old FT 100 (NOT THE "D")" all I would do is take them straight to AES in Orlando and trade them in on 3 new FT 100D's and 3 AM filters for them. I wouldn't even bother to hook them up because I know the FT 100 is the better rig by far even and especially knowing the 2 small and easily fixed "problems".

73 all the best, and Please buy the 706 and loose the address to this group and let the 706 group pat you an the back for buying a deaf and dumb rig.

Subject: [FT100] Passion, problems & my $0.02 ;-)

I can appreciate how some are happy with, and passionate about their FT-100. I too, happen to think it's a radio with good features (even though I still have to get mine fixed.) I can also appreciate how some would feel after spending a bundle on the FT-100 and suffering one or more of these seemingly common faults or failures.

I don't think it's necessary to rub it in to people that are experiencing them and are just looking for help or ideas, nor belittle other radios or groups. Not everyone can do these mods to their radios either. And if I bought the radio new and found these problems ..... ? maybe I would be just as passionate in the negative sense.

What about the deaf RX problem? That's probably Problem No. 1 right now. No documented fix yet. $70+/hr bench time and 4-6 weeks to CA and then maybe a return trip to CA isn't for me.

Yaesu "lurks" here, probably got the ideas for some of their fixes from this group. They fix it and document it as an A0084XXXX, or the like on the invoice. My beef is, Yaesu should put out this info like another manufacturer does with their Service Bulletins. Or if they would like to have some deniability - "leak" the mod out.

I changed to the FT-100/ATAS-100 for the flexibility of the ATAS-100 antenna setup. PLUS - a better noise blanker, a good audio DSP band pass, and the ATAS. There are numerous Minuses but I can overlook them for the benefit of the ATAS system as I can't use large/long antennas.

I still have to do fan and hi-swr mods. Still need to troubleshoot (with circuit chiller) the cause of the thermally caused deaf RX. I don't know if the fan mod would prevent deaf RX aside from hopefully saving the V/U finals. I continue to use it even though I can't go on 10M. It's winter and I keep the car interior cool - it allows me to use the radio - although deaf RX sets in if I keep it on for long periods. BTW, my comments are in reference to my previous mobile installation - a 706MKII / LDG auto tuner and hamsticks.

Let's keep the ideas and information going.
Let's promote goodwill and common courtesy.
Let's enjoy our hobby.

> electronic product.
>
With all due respect, I wonder where you got this number.
If this is true, the normal failure rate for ham rigs in general must be
.05%!
Although I much prefer the FT-100 to the 706, I am enough of a realist to
understand that there are tons of problem comments all over the web and
the bands about my FT-100, and very very few about the
operationally-inferior-but-better-QC ICOM 706. The ostrich-like attitude
of some hams is perplexing...we did not design the rig, we make no money
off it, it is not of our family...If you have no personal stake in it,
please face facts.

73,
Paul K4PDM
>

The 5% falure estimate was by using a little "Kentucky Windage". I'm sure that in reality it is far less than that, but I came up with that guestimate from doing a quick count of the negative posters here and in the newsgroups and counted about 200 different people with problems. If Yaesu only sold 4,000 rigs, then this would amount to a 5% failure rate.

In my personal experiences, out of myself and the others I know that are running an FT-100 (7 total) there have been Zero problems, so in my case the rig has proved to be 100% reliable - but that's the basic problem with statistics. Depending on your data sources, "your milage may vary" :>)

Well, I once worked for a major manufacturer of consumer electronics goods (VCR's, home and car audio), and their anticipated failure rate for any product was 5%. That was the target number that they based their warranty dollar reserves, production run spares, and cost-to-wholesale price margin on. Some units did much better, and some did worse. Those that did worse were quickly discontinued from the current product line.

Every reflector, on every radio has people crying about something. My FT100 is one of the originals, it has been back to CA Twice ( noisy fans, high SWR cost me a whole $10)and it is still the BEST MAGIC BLACK BOX I have ever owned. I ever worked Greenland mobile about two weeks ago.
I don't understand the big deal about AM. If you bought this for CB, then you spend an extra $950 for nothing. I use a $50 Robyn for CB, works great, although it is tough to listen to 20,000 conversations at once on 19.

You are smart to ask. The way I did it is I used a tiny jeweler's screwdriver and worked on the rubber gasket at the "top" end of the mic. Can you see how there is a little slot there so you can just barely work the element out? Don't pull on the wires! Once you get the element out then the baffle should just drop right out; if not get the tweezers. Be sure to poke a needle through the 3rd hole. Then carefully put the element back in. Again, that takes some doing also. Someone else held the plastic front piece and I finally got the thing started. Just take your time. You have to sort of line up the grommet all the way around and carefully work the element in there. Don't rush it. You'll get it.
Let me know when you do.

# 12630. RE: [FT100] 2 Meter Mess

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-28 03:17:37 UTC
From: J. Morgan Ringold
Topic: 12621  Message: 12630

Howard;

I guess I did say it wrong. The Larson antenna is set for the 2 meter band. However, it has been used for over 6 months on 147.075 using an FT-1500 without problems and although I can't remember the actual SWR reading when I checked the antenna several months ago on this frequency - I do know it was very low. I guess my point is that I have a known good antenna and the ATAS and both gives the same high SWR icon on 2 meters.

Subject: Re: [FT100] 2 Meter Mess

Morgan

In 20 years I have never seen a larson factory tuned antenna. Larson ships antennas for a band, it is up the buyer to tune the antenna for the proper frequency. I would check the tuning of the antenna.

>>> jringold@... 02/27/02 08:01PM >>>
I currently have an FT-100D, ATAS-100 Antenna, and a Larson Factory Tuned 2
Meter Antenna. Purchased FT-100 in Dec and had high SWR probs on 20 & 40 meters. Returned to CA where it sat for 8 weeks. Just reinstalled last week. Now, SWR problem is gone on HF bands. However, now I have an SWR issue on 2 meter FM. Radio was connected to ATAS and noticed when working local repeater SWR icon came on and power dropped from 50W to about 20W. I
still had the Larson factory tuned 2-meter antenna installed and knew it worked correctly when I had the FT-1500 installed (the week previous). Plugged 2/440 pigtail into Larson with same problem. However, I noted that

during a single transmission the rig will display the High SWR icon and cut
the power down. Then during the same transmission - without even unkeying
the mic - the SWR icon will disappear and power goes back up. Keep in mind
this happens with 2 separate antennas with 2 separate feed lines.

The only thing I can figure is that Yaesu has the SWR threshold set very low
(for example 1.2 to 1) and maybe I'm somewhere between 1.19 to 1 and 1.21 to
1. I haven't yet checked the SWR but several months ago the Larson antenna
reported good SWR and has always performed fine on the FT-1500.

At this point I'm at a loss. I plan to check the SWR this weekend on both
antennas - but I am wondering - does anyone know what the actual SWR
threshold for the FT-100D? Are there any other thoughts on what this could
be?

Thanks much and Best 73,
de KG4PAN
Morgan

Sounds like a problem I had. RF feed back from a resonate feed line. Try using a cable the same length that is not connected to anything and hook it up to the HF port, see if the cable length need to be changed for the HF antenna. Or you may be getting RF in from the power cable or speaker cable. unplug any speakers that maybe plugged in. Is this rig remote mounted or is it in one piece?

However, I noted that during a single transmission the rig will display the High SWR icon and cut the power down. Then during the same transmission - without even unkeying the mic - the SWR icon will disappear and power goes back up. Keep in mind this happens with 2 separate antennas with 2 separate feed lines.

The only thing I can figure is that Yaesu has the SWR threshold set very low (for example 1.2 to 1) and maybe I'm somewhere between 1.19 to 1 and 1.21 to 1. I haven't yet checked the SWR but several months ago the Larson antenna reported good SWR and has always performed fine on the FT-1500.

At this point I'm at a loss. I plan to check the SWR this weekend on both antennas - but I am wondering - does anyone know what the actual SWR threshold for the FT-100D? Are there any other thoughts on what this could be?

Thanks much and Best 73,
de KG4PAN
Morgan

# 12632. The wonderfull FT100D

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-28 06:08:26 UTC
From: The Scholtz's
Topic: 12632  Message: 12632

After watching these posts for a couple weeks, I went and purchased a used ft100D (in mint condition) the radio had only MINUTES of use prior to my getting ahold of it. I am a repair technician at a Motorola shop an after hearing of some of the problems people have had with this radio, (everything but the mic mod, excellent idea!) all sound like ground problems. So, this in mind, I took the cover off of my FT100D and looked inside. I see NO benifit to be gained by grounding the RF shields the the aluminum frame that they are already attached to via several solder points to the circut board, which in turn is screwed to the VERY CASE your grounding to. As with most of us Hams, I often think the worst when something goes wrong, and would probably think up some "complex bandaid" as a solution. But I used the K.I.S.S. method and tried the obvious first. I simply took out my #1 phillips and put a turn on EVERY screw that mounts the boards to the case. I think Yaesu has an 8 year old girl putting these screws in! I got a FULL turn on every one. And the heat sinks on ALL the finals took a couple turns to tighten them up. Allthough I havent experianced any problems with my radio ( I havent put it in my truck yet) It would not suprise me if the finals burnt up, or the 10meter fluttered, or the fans werent dependable..... with those screws loose like that! All in all after looking inside that radio I am impressed. Take the cover off your radios and TIGHTEN those screws! They are, in some cases, the only path to ground for several circuts!

And to the one who was up in the air over FT100's and IC706's I am with the majority. HANDS DOWN the FT100 is better!

IT HAS TO BE!, I read a post here where someone was getting their DC ground from their antenna feedline! AND it sounds like after he corrected that, his FT100 is still working! Try that with an "ICUM"!

Just my 2 cents worth!

Jack,
I used a large sewing needle to pry the rubber mic mounting out of the hole. Just ease it up a little on each side until it's out. A curved dental tool would probably be perfect for this job.

Topic: 12571  Message: 12636

Why don't you just order them direct from Powerwerx ( www.powerwerx.com ).

If you order a decent number then the shipping from the US is not that bad. That is how I obtained mine here in Australia. I have ordered twice from them, each time I got 100 sets. Their despatch is very good. Took about 9 or 10 days to get to me.

I have already used up the first 100 and am into the second 100. I also got some of the 75A ones for larger battery connections.

Maybe a few of you can get together and order a quantity of them for even bigger savings. We have also done that at our local radio club.

Thanks to all that replied, getting hold of these Powerpoles is not that easy in the UK, the distributer won't e them and the retailers only carry the SB50's which I don't think are suitable. RS Components who retail these,
will sell me 10 of each colour but will charge me huge amounts to send them
to me!!. They will sell me them over the counter if I am trade, which I am not.
I won't give up though!!!!!!

# 12639. Want to use FT100+Headset while mobile - any recommandations??

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-28 10:38:56 UTC
From: Lenz Grassl
Topic: 12639  Message: 12639

Hi the whole group!

I use my FT100 since 2.5 years. I like this radio and now I thought to use it with a headset especially for the mobile operation.

Are there any recommandations WHICH headset is best for ham-radio usage and suitable for the FT100 as well? How much are such kind of headsets?

Thanks for all your hints!

Lenz, DL8RDL

All, I did the mod last night, completly but... I still looking for good reports, better than my ?706 with stock mic. I do believe that we need find another mic to this rig, because it?s a worderful machine. It?s hard to believe but in my case, same day, same antenna and same frequency the worst reports I get is related to FT100D. Bye ---
backhoefade wrote: You are smart to ask. The way I did it is I used a tiny jeweler's screwdriver and worked on the rubber gasket at the "top" end of the
mic. Can you see how there is a little slot there so you can just
barely work the element out? Don't pull on the wires! Once you get
the element out then the baffle should just drop right out; if not
get the tweezers. Be sure to poke a needle through the 3rd hole.
Then carefully put the element back in. Again, that takes some doing
also. Someone else held the plastic front piece and I finally got the
thing started. Just take your time. You have to sort of line up the
grommet all the way around and carefully work the element in there.
Don't rush it. You'll get it.
Let me know when you do.

No no, cellar as in

Definition
<http://dictionary.cambridge.org/assets/definition_heading.gif>

(from Cambridge International Dictionary of
<http://uk.cambridge.org/elt/cide> English)

cellar
noun [C]
a room under the ground floor of a building, usually used for storage

Are you having trouble with the language?

Cliff

--- In FT100@y..., "Steve Jones" <nx1g@r...> wrote:
> I have one response to you and your attack on me because I asked for good solid feedback and give me a break on the either a diode or resistor or whatever. You sound like someone that would take issue with anybody and everybody if they question the reliability of a product you own like it is family or something...it's just a piece of electronics, get a grip. Read my MSG, I don't like Icums and yes I mean Icums. I am a Yaesu fan, but I don't buy radio gear with my hard earned money if it has problems, the FT100D has problems, you know it, I know it and so do most people. They have just had to band aide them to make the radio work like it should from Yaesu to start with. If you don't like my post, you know how to hit the delete button don't you since you know how to fix all those problems with the FT100 so surely you can hit the delete button. This is America and this is a free country. If the person who moderates this group does not like how I responded to KG4FET then band me from the board. If this is the kind of crap you get for asking an honest and fair question, I don't need the hassle. 73 and thanks to those who were man enough respond like grown men instead of this guy who acted like I hurt his and his FT100D's feelings, hi hi LOL. 73, Steve

Steve,
It was not ment to be an attack and I admit that it did sound taht way and I apologize. What my problem is that we get guys coming in the group on a regular basis slaming the FT 100 for it's numerouas problems. What it boils down to is thatt it has 2 major problems and 2 well one now minor problem. As far as I am concerened If you dont own one and you are thinking about buying one then why come in and slam the rig before you even buy one? I think that going into buying a rig with you eyes open knowing it potentialy has a couple of well documented problem and that the remedies are quite simple IE do it yourself or send it back to the factory before you even get a chance to miss the rig. With a 6-8 week turn around on Warranty repairs and you have had a chance to really get to know the rig YOU WILL MISS IT!

I usually answer almost all of the 706 VS FT 100 posts in a positive manner pointing out all of the good AND bad points of the FT 100 and even some goods points about the IC 706. Someting in your origimal post just struck the wrong cord with me and I went off. I do apologize. This is how I would have normally answered the debate

FT 100 Pros/706 cons
A working NB that is user adjustable via the function menu. The 706's is all but usless

A funtional DSP

Tone encode and DEcode. Decode is not an option with the 706

Easy to navigate menus with understandable abreviations.
Single button Short cuts to often used selections in the Function menu.

300 Memories plus a bunch nore for Home Freq's. strange offset such as sattelites, and Band limits for scanning.

Wider RX/TX ranges when moddified

Better all around RX with 100% better rejection of intermod and adjacent channel. It maybe that the FT 100 and the 706 almost look identical in the published specs on RX'er sensitivity, However in real World conditions the FT 100 wins the RX'er contest hands down in side by side comparisons IN THE REAL WORLD not on a work bench in a lab.

FT 100 cons
Know problems with SWR in 10 mtrs. The fix is widely published on the net.

Fans do not cycle as they should on U/VHF. Again the fix is widely published on the net.

No true cross band repeat.

unable to use the mics keypad for direct freq entry. This is a HUGE problem for a mobile rig. This means you have to take your eyes off the road to dial a freq in if it is not in memory.

Limited CAT usability. there are a large amount of functions available via CAT. If CAT is one of the major buying points on a rig trade all of the good stuff the FT 100 offers off for a 706. Things such as the DSP and its adjustment ARE NOT available through CAT.

Again I believe that know what you are possibly getting into (some places such as HRO I hear have already modded rigs in stock) when you purchase the FT 100 makes you an educated consumer. I do not believe that we should have to buy a rig that may not work correctly out of the box. With the 706 you might get a good rig you might not. You wont find much about problems with it in the major groups but that is because (and I have seen it happen)they remove the postings complaining about a problem with the rig. I have seen this happen in 2 big boards.

You are lucky. I hope you are not implying that the rest of us did not make sure all the screws were tight before we tried something else! Nothing got rid of my spurious oscillation,even into a dummy load, until I improved the internal grounding. Many others have had the same experience.

It is very frustrating to see, after all the well-documented incidents posted for the last couple of years, that people still refuse to believe that these widespread problems exist. This group is largely made up of people with extensive amateur and/or commercial experience (in my case, broadcasting for 26 years.)

I do not doubt that you, at least temporarily, fixed your rig. I also say again, you are lucky to have one that is so easily fixed.

I want to thank the group for all the useful information for the last two years and say again that the FT-100 is a wonderful rig when working right, and I feel that it has been worth working through its considerable problems. Not that anyone cares, but I feel that this will be my last posting on the subject.

Steve - I take everything I read with a grain of salt. Sometimes a whole bag of it. I have no numbers on it but I also suspect that we mostly hear the problems and little of everyone whose radio works fine. Just look at the newspaper or the TV news - do you see stories about things that went right?

I am the second person 2 use the FT-100/ATAS-100 combo in my car. As far as I know the covers have never been off of it. I get good reports from everyone I talk to. One person even was surprised that I was signing mobile - he said I sounded like a base station. I hope that my experience is typical rather than a lucky one.

My advise would be to play with all of the rigs you are looking at and see which one is easiest for YOU to use. . . especially if you are going to use it mobile where I think that ease of operation tops all other consideration.

Of course take all of this with a grain of salt too. But it's my opinion - your mileage may vary.

I use the Heil BM-10-5 and find the audio quality based on reports is
great.

# 12651. SWR - FT100 - ATAS100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-02-28 14:38:34 UTC
From: gerdathen
Topic: 12651  Message: 12651

Hi there,

I am also an owner of the best rig "FT100" and using an ATAS100 too.

I did not do the SWR Mod, because I mod my mind and went back to my books.

Where should we check the SWR? Direct at the Antenna, OR ? I did and found out that it is different than behind the TRX !!!!!!!!

What is between it? Cable, isn't it?

Some change of cable with different length, gave different results, so I started thinking again and it was easy to find out why.

We are using usably half wave length antennas and nobody care about the cable length, but we also should tune the cable by the length !!!!

I checked the bands to get the worse result, at my on 20 meters at 14.313 Mhz, I am using to get the Intermare information for sailors. The cable I am using is RG213

The shorting factor for it is 0.66.

I set up my cable (( c/2 for have wave * 0.66) / 14.313) = 6.917m
the length from the radio to the antenna is about 9 meters, so I made a cable twice 6.917 m ( in one piece J)) and rechecked the SWR, it was excellent. I never get that bat SWR Icon again.

Now, I am using a diplexer, so I shorted the HF Cable a bit, related to the physical length internal the diplexer and did the same calculation for 2 meter and prepared a separated cable for 2 m and 70 cm to be changed.

Think about it, have you own experience and you will have more fun with this little black box, I never will give away.

Best Regards Gerhard

The ft-100 was sent to CA third week in Jan and rec'd 25th January.
Logged in the 4th of Feb. Not bad. Checked today, 5 more weeks.
Hope that helps someone else that is waaiting. Thanks Mark KG8DP

Of course that's the required mod. Do you think the Yaesu service center would spend time adding an unnecessary bandaid that doesn't really help? They already elected to "save cost" by not having a recommended recall. The need for the straps is confirmed. It's just a shame that the rig ever needed it. True thought, some of the marginally unstable rigs may "get well" by just cranking down on the screws. I found months ago that adding some Eco-sorb material helped too. But I found that the added straps yielded absolutely rock solid results.

# 12656. Interesting yaesu problem

Yahoo group: FT100 (2002-01 — 2002-06)

From: kg4mex
Topic: 12656  Message: 12656

I recently acquired 2 FT 100d's

They were 23 numbers apart (close date of manufacture-probably same week)

One had the bad swr issue right out of the box
One works flawlessly.

Interesting.

Does anyone have the swr mods in a better picture than the one posted here>? i cant see it well enough to tell where they go...

Thanks

Chris

I've found that for the japanese versions, the best
course of action is to smack the CPU several times
with a small ball-peen hammer.

That usually knocks the cpu into place and then the
radio opens up for full tx/rx!!

:)

Just bought and installed a Larsen 2/440 antenna after mine was stolen. The label on the antenna plastic bag says PRE TUNED no adjustment needed. Why does Larsen say this if tuning is required? They should keep quiet, and the ham would then assume that tuning WAS required.

# 12660. Re: [FT100] Digest Number 1127

Will this mod help the audio on any other of my Yaesu rigs - like the FT8100?

# 12662. New or Stubborn owner?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-01 02:44:08 UTC
From: ft100guy
Topic: 12662  Message: 12662

A few word of advice to those who are new or those who refuse to believe the truth.

This rig must have the swr mod and fan mod performed BEFORE you have trouble. Dont make calls to Yaesu as it has been established here that they are less than "forthright" on the topic. The first thing you must do is make sure your rig contains the swr mod, open the top cover and look for it (hint: match your rig to the one shown in the FT100 archives).

Mod the fan ground with the resistor, you can post here all you want and say that "mine is fine" etc. To those who know, you are simply being foolish and needless to say inserting your foot in your pie hole. Too many people have been blowing finals and suffering with Hi SWR falsing to stop now and listen to your opinion.

Listen to whats been established here, we all want these rigs to sound nice and work as expected. Forget what you think and do what the radio requires to be right. In many cases Yaesu will perform these mods or some variation of the above to these rigs when under warranty or in some cases even after..

Many of us here have spent a few nights with mucho cups of coffee trying to iron out the bugs. Wanna set your new rig up right then make sure you install this thing right.

Firstly, begin by going thru the archives here to see whats what. Alot can be learned and pitfalls avoided if you read and download some of the stuff there. Also check out Lee's site to gain understanding about the care and feeding of FT100's. Check below for some basic practices when installing this radio, below are mobile examples, just follow these quidelines for starters and use it for base installations also.

1. Fan Mod (Yaesu will perform this using a thermal switch, I like the resistor better.)
2. SWR mod (Yaesu will do this as well.) Expect and 8 week delay though... :-(
3. Two grounds from the sides of the radio to the vehicle chassis or metal body, floor etc..
4. One ground near the base of the antenna and mount
5. Set your menus as posted here as these will offer up the best settings for starters.
6. A few loops of coax will also tame swr variances so this is a good idea too.
7. In the mobile, get a good external speaker (many like the

clearspeech dsp for use with the FT100.)
8. Do the Mic mod, getting complaints that the audio is muffled? Then poke out the third hole and remove the baffle. No ill effects in the mobile have been noted regarding noise so >>> get crackin.
9. Run your leads direct to the battery and make sure you swap out the crappy Yaesu fuse holders for some good ones.
10. Make sure you run this rig with no less than 12.5 volts as it is known that the rig is unhappy below that point. Run the vehicle if need be.
11. ATAS owners, use a good dual band antenna for UHF and VHF and avoid duplexors to use the ATAS for those bands. Its good in a pinch but the ATAS stinks on those bands and is much better suited for HF operation and its alright on 6m.

It sounds like alot to do but its imperative in any installation to have good grounding and an impeccable setup for things to work right. If you feel this is too much to do then mobile operating may not be for you. Modding and tinkering is what this is all about. This rig requires some attention to detail when installing but its well worth your time and effort.

Yes there are duds out there and there are radios which refuse to work as expected. Most are pretty good with a few of the mods done to them. Most work swell "outta da box" but expect swr problems as the sticky copper tape takes a dump. In addition prolonged use of the UHF and VHF bands without the fan mod will cause problems in a few areas (HF and UHF/VHF RX degradation and overheated voltage regulator for starters,) it may work swell now but smoke is in your future.

Good Luck with your rigs.. Regards.. Richy N2ZD

> Jeff Scholtz
> KCØJAO

Hi Jeff,

Your impressions were noted but in fact all of us had tried the above. One guy suggested star washers under the pc poards so the grounding points dig into the aluminum and soldered circles, great idea but it didnt always work. The points which are grounded as a documented mod prevent stray rf at those points indicated from

bleeding over to adjacent circuits. Your welcome to try it and report back but we have all found that the strap mod along with some other important mods help prevent future problems and failures.
Although nothing is perfect nor does everything last forever, these mods have helped keep countless FT100's working right and on the air.

PS. If you like the Mic mod, contact me for Paypal information, I will siphon off a few bucks to Chas for his baffle update to the mod :-)

Regards.. Richy N2ZD

# 12665. Re: The wonderfull FT100D

My Ft100,serial #9j100xxx was so bad that transmitting above 29 Mhz
send the cross needle meters on forward and reflected power right of
the scale.It did not even matter if the power was turned down to 0%
I tried to improve the grounding of the LPF board and the aluminum
frame by cleaning and tinning of the areas around the 5 mounting
holes,but even that did not solve the problem.
My suspicion is that these double sided boards have a poor RF ground
on the component side,so I did the SWR mod.with the ground straps on
the LPF board,but I went one step further and did the same thing on
the PA board since there have been reports of V/U finals failing even
when only receiving.Clearly something goes into oscillation and
distroys the power amp.
Prior to doing these mods,tuning up on 29 Mhz,the frequency counter
placed next to the antenna feedline would show abt.half this frequency
I'm glad to report that after these simple mods.the rig is as steady
as a rock.
I chose a 68 Ohm resistor for the fan mod.This keeps the rig nice and
cool and the fans are not too noisy that way.

hi Jeff ,

Thanks for the tip about tightening the screws.
Could you please recommend some torquing values ?
I would love to use my 1/4 inch Snap On torque wrench to help fix the FT-100 SWR problem.

Herman

Any chance of pictures of the mods you did to the PA board for the avoidance of doubt? The other mods are already documented of course. My FT100 is being repaired after suffering VHF/UHF failure, the HF PA failed early in its career and was repaired by Yaesu. When I get it back I wan't to make sure that the output is stable and the temperature is properly controlled.

If the antenna you bought is the dual band with the open spiral section, Model number is like 270 or 207 or similar (cant't remember) it is pre tuned. They are very specific with the instruction sheet. "DO NOT CUT".

There are several high resolution pictures of both
factory mods (SWR and thermal) shown in the FAQ. The
section on 'Intermittent High SWR' is at:

http://k0lee.com/ft100faq.html#intermittent

Richy,

I must respectfully disagree. Your suggestion of modding a radio that is working fine is just opening the window for trouble. Mine works great (always has) and has no need for ANY mods, even after running it for 48 continuously in the ARRL CW DX contest for 4800 contacts. A couple of guys on this list don't even know how to send email correctly and you are suggesting that they have the competency to work with surface mount electronics. I choose to just operate my rig and leave the covers on.

A few word of advice to those who are new or those who refuse to believe the truth.

This rig must have the swr mod and fan mod performed BEFORE you have trouble. Dont make calls to Yaesu as it has been established here that they are less than "forthright" on the topic. The first thing you must do is make sure your rig contains the swr mod, open the top cover and look for it (hint: match your rig to the one shown in the FT100 archives).

Bob

Tricky one this. Suppose I have a car that is subject to a recall (or not as the case may be): well mine's working fine so I won't bother having the mods done, pity my accelerator jams open sometime in the future.... OK this is an extreme example. The question is: Will Yaesu pay for your radio to be repaired if it blows up out of warranty? Then again if you sell it before the warranty expires you just don' t have to worry.

I've be very careful about suggesting that just because someone can't send an email they are therefore unable to work on SMD electronics. Almost all the correspondents to this group are US based but I don't slate their engineering ability just because they can't write proper English :-)

To all,

I can tell you with certainty that Yaesu WILL NOT repair a radio that is out of warranty even if it incurs one of the common failures documented here. Further, they will not admit there is a problem! I know this first hand because the VHF finals in my unmodified FT-100 went into oscillation and failed. Two weeks out of warranty. Yaesu quoted $505 to repair the FT-100. I don't think so!

I was going along reading these posts fat, dumb, and happy. I had the rig for a year and had no problems with it! Why worry? Well, now I've got a IC-706 in the truck, the FT-100 is sitting on the bench waiting on parts to arrive. For you do-it-yourselfers out there, the VHF/UHF final is a proprietary part only available from Yaesu at over $200 a copy.

So, if you like your FT-100 and it doesn't have the modifications in it, send it in and get them done before you too get to smell that special smell of solid -state electronics burning!

# 12676. Re: [FT100] 2 Meter Mess

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-01 16:34:20 UTC
From: Bob Cheek
Topic: 12621  Message: 12676

I've used Larsen Dual Banders for years and I have never ever tuned one. Never needed to. Mount it with a good ground and check the SWR (with a good meter) and I think you will find they are dead flat.

You need a good ground. I recommend a 3/4 NMO hole mount. Mag mounts rely on the capitance to the metal for the ground and are only suitable for temporary rental car type situations. Truck lip mounts can degrade with time because of rust and corrosion and who knows how well the deck lid is grounded?

Be advised that some of the inexpensive SWR meters that are typically sold for 11 meters will give some erratic readings at VHF/UHF frequencies. If you don't have one, find someone who has something like a Bird Wattmeter with the correct slugs and check the SWR.

Larsens are great antennas and work exceptionally well.

I'm afraid I must agree with Richy - when the high SWR shows up (and it will, because that copper tape WILL fritz up), it will destroy a set of finals in a BIG @#$%! HURRY!!! I did both mods on my radio (yes, by myself!) within 2 weeks of purchase, and also made sure all screws and connections were tight -- it took a couple of hours, but it has given me peace of mind when I run continuously for hours on end!! The truly sad state of this is that Yaesu refuses to admit this rig has the potential for these problems - and yet this is a GREAT RIG!!! The saving grace for owners so afflicted is this list -- we have people like Chas, Richy, Pres, et al. that have dealt with these issues and have provided their input. Thanks guys!!!!

73 de N4MVL - Lee

P.S. - I use a 51 ohm resistor in my fan mod - I use 'cans' in the house and portable, and my rig mounts under my rear seat on my Jeep for mobile -so no fan noise!

From: "Paul" <paul.warman@...>
Subject: Changing Repeater Shift Defaults

Chaps, I'm sure this is a very silly question but how do I change the 430Mhz repeater default frequency shift from the Stateside 5MHz to the UK 1.6Mhz. Every time I go into the menu system and change it to 1.6 it reverts back when I change channels. I'd appreciate any advice you can give.

Many thanks
Paul

Hey Rich - does that make us "co-inventors"?

If you really want to see one of my inventions go to the
USPTO website and look up #5530925. Wonder if we can put that
design into the FT-100D for VHF mobile work? No more picket-fencing!

Before I had mine mod'ed for the "SWR" problem I took a look at it with a spectrum analyzer. The spurious oscillations are at about 13.65 MHz and 2x and 3x that frequency. I found that it would stop when I lifted up the top lid a bit. The spurious tones would then drop 30, 40 dB or more; down below the noise floor of the analyzer at any rate. It looked as though there was some RF leaking back into the synthesizer causing it to output these spurious signals. Of course your 24 MHz or 28 MHz antenna is generally not resonant also at 13.65 MHz, hence the SWR icon turns on. Spurious oscillations in amplifers often equals dead amp.

that is what I did a while back, and it cured a lot of strange problems, even some receiver problems.

Subject: [FT100] The wonderfull FT100D

After watching these posts for a couple weeks, I went and purchased a used ft100D (in mint condition) the radio had only MINUTES of use prior to my getting ahold of it. I am a repair technician at a Motorola shop an after hearing of some of the problems people have had with this radio, (everything but the mic mod, excellent idea!) all sound like ground problems. So, this in mind, I took the cover off of my FT100D and looked inside. I see NO benifit to be gained by grounding the RF shields the the aluminum frame that they are already attached to via several solder points to the circut board, which in turn is screwed to the VERY CASE your grounding to. As with most of us Hams, I often think the worst when something goes wrong, and would probably think up some "complex bandaid" as a solution. But I used the K.I.S.S. method and tried the obvious first. I simply took out my #1 phillips and put a turn on EVERY screw that mounts the boards to the case. I think Yaesu has an 8 year old girl putting these screws in! I got a FULL turn on every one. And the heat sinks on ALL the finals took a couple turns to tighten them up. Allthough I havent experianced any problems with my radio ( I havent put it in my truck yet) It would not suprise me if the finals burnt up, or the 10meter fluttered, or the fans werent dependable..... with those screws loose like that! All in all after looking inside that radio I am impressed. Take the cover off your radios and TIGHTEN those screws! They are, in some cases, the only path to ground for several circuts!

And to the one who was up in the air over FT100's and IC706's I am with the majority. HANDS DOWN the FT100 is better!

IT HAS TO BE!, I read a post here where someone was getting their DC ground from their antenna feedline! AND it sounds like after he corrected that, his FT100 is still working! Try that with an "ICUM"!

Just my 2 cents worth!

# 12683. FT100 speaker systems

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-02 00:53:53 UTC
From: ve7baq
Topic: 12683  Message: 12683

While his is not strictly speaking an FT-100D only item, I think it still might qualify.
I have read several reviews on the Clear Speech Speaker System. Even listened to the website sound file. Most people seem to think it is a good item. Has anyone done a review on the MFJ-616 Speech Intelligibility Enhancer? The reason I am asking is that I also have quite a hearing loss at the higher audio frequencies and am wondering which would be the best accessory. I also have a rather high line noise level on 80 meters most of the time (right now while I am typing this it is S 8). If anyone has used the MFJ 616, I would appreciate the input. If anyone has used both the Clear Speech and the MFJ 616, and has a comparison that would be even better.
Thanks

Hello Bob and the Group

I took my FT100 to Yeasu to have the AM filter installed out of waranty. I complained that the rig was getting hot while in V/U recieve. I never had an SWR problem and did not say anything about SWR when I took it in. When I got my radio back from Yeasu both fan and SWR modes were done with no charge to me. I was haveing no trouble. Why would Yeasu Mod my radio if it was working fine?

BTW this radio is used primarily for 6M and 2M weak signal and has been performing good. I did have a recieve failure after the mod, this was attributed to the REF unit and replaced for $85. That was just a few months back check message number 11297 as I explained it all there.

# 12686. Re: [FT100] Re: New or Stubborn owner?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-01 15:28:14 UTC
From: Mike May
Topic: 12670  Message: 12686

I remember when I was green behind the ears on this list I had just opened up my first FT100D and checked out the list. I had the same attitude as some newcomers, I came on the list saying how great my Ft100D was and how it performed flawlessly and how others should not be bashing the Ft100/D. Both of my radios were grounded to the chassis, the trunk lids were bonded together the engine frame to the chassis all the good engineering practices from the HF mobiling handbook, I assumed that others on this list had never read this book before. I never started the engine with the radio turned on. You know all of the walking on eggs things that a lot of us do but I grew out of that attitude 2 radios later and a blown receiver pre-amp, blown VHF/UHF finals, high SWR icons. Even after having all of the mods done to the radios to tame it down and keep it nice and cool the same darn problems came again and again.

I learned the hard way that we all eat crow with the FT100/D sooner or later and I was respectful to the list members and actually ate my humble crow when I retracted my first impressions of the Ft100D after the first week on the list.

P/S I have had a KWD TS690S in my other larger car, yes it really does fit in a vehicle, for 12 years now with no problems running the same style 6 meter/10 meter antenna and V/U dual bander so no I'm not new to HF mobiling just to HF mobiling with the FT100D. I know what some of you are going to suggest but the FT100D was a present from the wife so no I can't replace it with another KWD TS690s, that's out of the question unless I want to sleep in the back yard with the dog.

P/S comparing e-mail to radio electronics is like comparing apples to oranges, e-mail and the internet are black magic anyway while RF is sensible understanding electronics, at least in my book it is.

I want to try using MMTTY with my FT-100. Before I re-invent the
wheel, has anyone done this. Do you use VOX to key the rig or PTT ?
I would prefer VOX. I have a freeware program called "Quickmixin"
that allows setting volume levels so hopefully I don't need an
external box of pots.
Thanks for any info,
73, Dick, W1KSZ

I don't see how what one choses to learn about e-mail has to do with this mod. In fact, I don't see how surface mount circuitry has anything do do with this mod, either.
However, I understand you not opening up a rig that doesn't need the mods...yet. But I would certainly consider doing the fan mod, as you won't realize that you need it until it is too late.

Herman,

You raise an interesting point. I am in the process of reworking my FT 100 and I've noticed that Yaesu are using what looks like yellow zinc plated self tappers to secure the pcb's

From past experience in an EMI/EMC engineering role, I found that the yellow zinc plating has a fairly high surface resistance and wreaks havoc with earthing until it is either broken down mechanically or via a high voltage discharge

This, coupled with the fact that there are badly defined etch resist clearances around mount points and bad tinning around PCB mounting holes may contribute to the instabilities

Will provide feedback on my further investigations

ATAS-1 permits the TUN button to retract the ATAS on 2/440. ATAS-2 doesn't.
You can hook a 2nd antenna up regardless.

Cliff,

I don't have a picture,but the mod.is very similair to the one performed on the LPF board,only this one I did on the bottom (PA) board.
I simply drilled with my Dremel Tool a small hole in the centre rib of the chassis,soldered the strap to the outside (ground side) of coax connector J3001 and used a small self tapping screw to connect it to the centre rib.
Just make sure you blow the metal shavings out.

73,Herman VE5HFD.

# 12693. Re: New or Stubborn owner?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-02 13:58:29 UTC
From: n9cv
Topic: 12662  Message: 12693

Well Said. This post should be saved and sent to all new FT-100 owners or new members of this board. This post covers about 90% of all questions / answers posted here. GOOD JOB.

It is amazing how many of the "mine is fine" people come back later and post "mine was fine". I know of two local hams that won't post "mine was fine" because they are too embarrassed to admit they had a problem, or that they bought a less than perfect radio.

It only took about a month for my FT-100D to go from "mine is fine" to "mine was fine". After a three month vacation in Cerritos for mods and fixing the heat damaged parts "mine is fine" again.

This is preventive maintenance like changing the oil in your car, except you only have to do it ONCE.

DO THE MODS. They are simple and in inexpensive for the "mine is fine group. They become very expensive in money and time for the "mine was fine" group.

What is the saying? "You can lead a horse to water but you can not make him drink." You have been warned thanks to the knowledge and experience of many hams on this forum.

# 12694. RE: [FT100] Re: New or Stubborn owner?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-02 15:05:56 UTC
From: Eric van de Weyer
Topic: 12662  Message: 12694

Well there is the old saying that an ounce of prevention is worth a pound of cure.

I only got my 100D about 3 months ago and have had no problem with it HOWEVER, having read many of the posts here I opened mine up to see what, if any, mods had been done.

It had the copper tape but that was all. I then proceeded to install both the grounding mod and the fan mod (I decided on a 100 ohm resistor) myself. I can now rest in peace knowing that the mods have been done so I am less lkely to have problems in the future.

I don't believe that it will void the warranty but then, even if it does, I have always done ALL my own repairs. It is usually far quicker than taking it to a dealer to get done. I also then know exactly what has been done to the radio and how it was done. A much better solution, in my oppinion.

To me, this is what Amateur Radio is all about.

From: Scott Willis
Topic: 12696  Message: 12696

Hi... I purchased one of the original FT100's, and it swallowed it's gum and choked on it 3 times!! Yaesu had the radio for much longer than I did. It SUCKED!! I sold the radio because of it's obvious unreliable state, and have hated them ever since. I'm now thinking about getting another one since they've had a chance to get the radio RIGHT now they've been making them for a while, especially with the D model coming out now. But as I read posts here, I realize that Yaesu hasn't changed, and they've still got mega problems with this rig. I've still got my mount on my truck for the ATAS-100, and like having one antenna that does it all, but I'm very sceptical about making another FT100 purchase, because of being burned so bad by this rig in the past. I'm considering the TS-2000 instead, but with 5 antenna jacks on the back of the rig, it's not as simple as the FT-100 to go mobile. This leaves me frustrated and confused. A friend told me that the Icom 706mk2g is the answer, but.... =( You'd think that a company like Yaesu would just make a quality product. Can anyone shed some light on my frustration?
Scott

# 12698. mike mod info

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-03 02:07:39 UTC
From: recurve95
Topic: 12698  Message: 12698

For those in the group looking for the microphone mod...

Why is there a microphone mod????
Some 100 and 100D's suffer from muffled tx audio, and in an effort to compensate for bad tx audio, many hams are forced to compensate by using the menus to adjust the tx audio characteristics.

Do I have muffled audio???
Only one good way to find out and thats to get on the air with a buddy and have him critically listen to your tx audio. It helps if you can use another rig and compare the 100(D) to the other rig.

OK..I have muffled audio, now what???
Open up the handmike, being careful not to break the wires at the bottom of mike. Remove the 3 large screws and one small screw (on the PTT switch) that secures the circuit board inside the mike. Carefully lift the board straight up over the black screw post. The mic element is pressed into its holder and held in place with a spongy rubber material. It can be removed by very carefully prying it up with a pocket knife...resist the urge to pull on the two wires that are soldered to the element itself....you will break them if you do. Once the element is out, the front of the microphone housing will be free. Look inside the cavity where the element was and you will notice a small plastic circle with the top part cut off of it. Remove this small plastic piece by tapping the microphone case against the desk. It might be stubborn and require the use of a needle to remove it...just gently pry it out. Once the plastic baffle is removed you will be able to see the two small holes that allow sound to pass through the microphone case to the element. You will notice that one of the holes is blanked off. Use a needle and gently open up the hole so you end up with three open holes. Reassemble the mike. If you have changed any of your menu settings to compensate for muffled audio, dont forget to put them back to the factory default settings. THATS IT. Its one of the simplest mods to make to the 100 / 100d and its likely the one that will make the most difference to the people that listen to your signal.

I spent the day up on 17 meters and talked to quite a few 100d users, and got nothing but excellent audio complements, and complements from other rig users that swore that I wasnt on a Yaesu. Modified mike and factory default settings for tx audio and thats it.

Good Luck and Have FUN!!!
Dave

# 12699. Should I get a FT100d ?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-03 02:24:52 UTC
From: kd6ccp
Topic: 12699  Message: 12699

I need a good mobil radio. I have looked long and hard at the FT100d, the icom 706 and the Kenwood 50s. The new Kenwood ts2000 also looks good. So now am stuck. The FT100d with the matching auto antenna seems like a great way to go. Any pointers, suggestions or help would be great. Thanks,,,

--- In FT100@y..., "kenlind81" <kenlind@i...> wrote:
> Where can I find the mike mod? and what does it do?

Easy, remove the screws on the mic, open it, remove the pc board screws and the one holding down the ptt switch, carefully remove the mic element from its holder. Note the third hole is unopened, open it with a sewing needle and remove the baffle (plastic disc). Reassemble and be heard.. Regards.. Richy N2ZD

What does it do? Makes the radio sound as it should, like a radio and not a tin can with a string.. :-)

# 12701. RE: [FT100] Should I get a FT100d ?

The Kenwood TS-2000 is in a different league but is not really a mobile radio.

Topic: 12696  Message: 12702

Hi Scott,

It sounds like you need a hug.

Seriously, FT100s are great radios, as long as you take notice as to whether they exhibit a few easily corrected problems.

The first and most talked about is the high SWR issue. This is a result of the internal grounding not working correctly. There have been many reports on how to fix this, but the most effective fix is shown in the FAQ. The FAQ address is given in my .sig. Just look under 'SWR problems'.

Secondly, there's been a lot of discussion about a fan modification. This mod keeps the fans on all the time, even in V/U receive mode when they would otherwise be off. The only person who has done any measurements on the rig has found that with the fans off, the internal temperature rise is about 30F, which is generally well below the maximum operating specification of rig unless the ambient is approaching 130F. This brings us to the next issue which some think is a result of not having the fans on during V/U receive. [I know that electronic equipment works better at cooler temperatures so I'd recommend the fan mod just for peace of mind.]

Blown V/U final. We've seen about 6 reports on this list of a blown V/U final transistor. This wouldn't normally be a big issue, except that the output transistor costs $200 and in no reported instance did it occur during a transmission. Therefore, the output transistor blew out while the radio was *receiving*. This is almost unheard of since the temperature of the output transistor is likely to be quite cool during receive and so there's no reason for it to short, which is the failure mode reported. Incidentally, when this transistor shorts, it draws about 20 amps so the radio gets really hot since the fans are off. Initially, the first blown V/U final failures were blamed on solder flux inadvertently left on the board, but this should not be an issue any more.

Most recently there has been a modification reported
related to the microphone that calls for the drilling
out of a 'false hole' in the plastic housing as well
as the removal of an internal baffle. No one has yet
captured a 'before and after' audio test, but several
owners have reported getting less muffled audio
reported with this mod. I've had my radio for two
years with a stock microphone and have never received
a report of a muffled audio. I think this mod needs
some more data in the form of 'before and after'
recordings of the mic before it can be recommended as
a 'must'.

# 12704. Re: 2 Meter Mess

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-03 05:23:50 UTC
From: n9cv
Topic: 12621  Message: 12704

I tried to "improve" the tuning on one of these dual band antennae once. When I got done trimming it, it was trash. The trash is where it ended up. Do not tune it. It is the best it will be out of the box.

Ken - N9CV_

>Just bought and installed a Larsen 2/440 antenna after mine was stolen.
>The label on the antenna plastic bag says PRE TUNED no adjustment
>needed. Why does Larsen say this if tuning is required? They should
>keep quiet, and the ham would then assume that tuning WAS required.

You are at the same place I was at a year ago. No matter who you talk to, the radio they own is the best. I decided on the FT-100D for four reasons:

1. The noise blanker was reported to be supurb to the Icom and Kenwood.
2. No antenna tuner and no switching of antennas was needed when using the FT-100/ATAS-100 combination. I could tune it between bands on the fly while driving.
3. The ATAS 100 was small and compact (compared to other screwdriver antennae) so I could get into my residential garage without removing it.
4. A Vice President of Yaesu told me that all new radios being sold had been modified to fix the previously reported SWR and cooling problems.

After buying a new FT-100D I found that items 1, 2, and 3 were definately true. I also found that Yaesu lied to me about item 4.

Item 4 is easily fixed by the ham in the field or by mailing the FT-100 to Yaesu in Ceritos, California.

While attending a US/Canadian hamfest in the International Peace Garden (Manitoba/North Dakota), I did several side by side comparisons with another ham that had an ICOM 706. My FT-100 severely beat the ICOM in both receive and TX. This comparison was only on 17 meters because that was the only antenna he had at the time. He had a dipole strung between the trees, and I had the ATAS 100 mounted on my Blazer. I heard and worked stations that he could not hear. If you can not hear them, you can't work them.

My advice is get the FT-100. Do or have the mods done immediately and you will love this unit.

I am not a Yeasu Bigot. I have mostly Icom UHF/VHF equipment and Kenwood HF gear.

You will like this rig if you want a mobile HF / VHF rig in one small unit. I have mine remote mounted with only the control head up front.

Hello fellow modders...

I decided to do the mike-mod and when I openend the mike I
noticed on the pc-board a small box with the letters sp in it and a =
and - sign just above (or below depending how you look at the pc-
board) on it.
I wonder if this is for connecting a speaker to it?
Looking to the mike housing there should be room for one.
Any ideas?

My mike has 19 holes in it!!!

So maube the european version of the FT100 mike is a little
different than the USA version.

So what I did was loosen the tiny mike from the pc-board and put it
in the hole in the housing. Mine was just above this housing hole as
it was glued to the pc-board. I get good reports on VHF now. But I
also have put the dsp mic eq (menu 16) on 2.

Hallo Jan,

You must have the mike without the DTMF pad,we seem to get the one
with key pad and the mike element is mounted in the shell and
connected to the circuit board with short wires.

first place to start is check out your power supply and station grounding. Helping others with this problem on various other rigs almost always leads to a ground loop problem or power supply voltage fluctuation.

Hi David,

You did it the "right" way, in my opinion. You recognized that, either through your own time constraints or recognition of additional technical skill required to install the filter, your interests were better served if Yaesu performed the work. If Yaesu installed the filter (or mods) incorrectly, they would become liable. My point was that I see guys blaming the rig as being "defective", when their own lack of technical skill can damage the rig more than any potential long term design flaw. If I ever decide to open up my rig and do the mods, I will take responsibility for anything I break while performing the surgery or during installation. I won't blame the rig.

As far as your point about Yaesu installing the mods without being asked, I think this makes perfect sense, since the rig is already opened and in the hands of a (supposedly) competent technician, any mod that has even a small possibility of increasing the life of the rig, is a good idea. I'm sure they also cleaned the fans blades and removed accumulated dirt that could build up and cause a heat failure, even while receiving. All good operating practice!

And Cliff,

I understand your point, but still believe that there is a correlation between the two concepts. The care and attention to detail spent to craft a successful outcome are skills required by both endeavors. US correspondents are handicapped, of course, (by at least 50% imho) because we are not able to document our thoughts in acceptable Queen's English, however, we still impress bias upon our own, when even these limited writing standards are not met. I, for one, appreciate your ability to transcend this limitation and maintain a hearty discourse in spite of the challenge. ;-)

I am confused by your question? Usually the ATAS-100 is controlled by pressing the TUN button on the FT-100 control head. The FT-100 control head can be mounted directly on the front of the radio or remote mounted using a separation cable/kit. Are you asking for a separate control head just for the ATAS-100?

Hello all.

I have recently bought a new FT100D and have noticed that on certain frequencies on VHF and UHF to get maximum signal strength on FM I have to to tune the VFO slightly LF. according to my supplier "who have already swapped one unit" this is probably to do with the design.

Any comments anyone

Subject: [FT100] Want to use FT100+Headset while mobile - any recommandations??

Hi the whole group!

I use my FT100 since 2.5 years. I like this radio and now I thought to use it with a headset especially for the mobile operation.

Are there any recommandations WHICH headset is best for ham-radio usage and suitable for the FT100 as well? How much are such kind of headsets?

Thanks for all your hints!

Lenz, DL8RDL

Why the hell should anyone buy this rig and then have to either ship
it back to Yaesu for the "mods" or do it them themselves. This is
"nuts"!

Herr Grassl,

I have had great luck with the Heil mini-headset. It is lightweight and can plug directly into the microphone into by simply using the correct RJ-12 connector (RJ-11 has 4 connectors, RJ-12 uses 6). Cost is around $100US the last time I checked.

Good luck,
Bob K5WA

Subject: [FT100] Want to use FT100+Headset while mobile - any recommandations??

Hi the whole group!

I use my FT100 since 2.5 years. I like this radio and now I thought to use it with a headset especially for the mobile operation.

Are there any recommandations WHICH headset is best for ham-radio usage and suitable for the FT100 as well? How much are such kind of headsets?

Thanks for all your hints!

Lenz, DL8RDL

# 12735. New Poll on recommending the FT100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-06 06:30:59 UTC
From: Lee Devlin
Topic: 12735  Message: 12735

I submitted a new poll to check on the likelihood of
current FT100 owners recommending the rig to others.
We often get new members asking whether or not they
should buy the FT100 and so here's your chance to
stand up and be counted. Often, this type of question
from a new member degenerates into a heated debate,
but I think what a prospective owner really wants to
know is if current owners are happy enough with their
FT100 to recommend it to others.

To vote, visit:

http://groups.yahoo.com/group/FT100/polls

Have fun,

=====

From: Cliff Bryant
Topic: 12719  Message: 12738

Just got my FT100 back after the VHF/UHF PA was replaced. Out of warranty so it cost me 230 UK Pounds (about 320 USD I guess)
I asked them to fit the PA thermal switch which they did. I've modded the unit now with the RF bonding for the HF PA (some of it had already been done during a previous trip to the repair shop) and also added a 100R resistor to keep the fans on all the time.

Having now got back to work (finally) I left the rig on the bench powered up but basically doing nothing with the audio is muted. Interestingly, but not surprisingly, the fans periodically turn on for a few minutes. Hence the PA device is getting pretty hot even during receive.

I would definitely recommend that the cooling modifications are carried out to the radio!

If the fans ever fail or get clogged up I reckon that the radio will be toast (literally!) At 230 Pounds ago I'm not impressed, mind you I'm not saying that the VHF/UHF PA will fail every time it gets hot, but a cool radio is a happy radio in my experience.

The VHF/UHF PA is a custom part I believe and it costs 134 UK Pounds (200 USD??) a throw. Ouch!

Cliff

Subject: Re: [FT100] Re: the atas 100 remote

> Yes the separate control head for the atas 100

Maybe this information is/should be found in the FAQ

A firm makes a control for the ATAS-100 for almost $100.00

I made one for under $20

Basically, you need a box, 2 SO-239 sockets, a DPDT momentary center-off switch, a 100uH choke, a .1uF feedthrough capacitor, and some .01uF bypass caps to ground and finally a 7808 DC regulator.

Wire the 2 sockets as close together as practical. Couple them together with the .1uF cap.

radio >------||-------< ant
.1uF

From the center contact of the antenna socket, run the 100uH choke over to the center common contact of the DPDT switch. Bypass to ground with a .01

radio >------||-------< ant
^----((((((-----> to 8 or 12v by
monentary switch
100 uH choke

The contact for "up" gets momentary straight 12v, bypassed to ground with a .01

The contact for "down" gets the 7808 output, momentary, 8v, bypassed to ground with a .01

This actually can work through 2m if you use coax between the sockets, although the SWR gets dicey above that.

I would suggest using it only for HF-->6m anyway. Watch your SWR indicator for the dip.

Thanks

Re the FT-100(D) mods:
I have an FT-100D Serial 9K12------ from which I deducted the manufacture date was September 1999.
After reading many of the posts regarding after purchase factory repair mods and owner mods I decided to open my rig up and take a look-see.
When I took the bottom and top covers off, I discovered that there were strips of copper on all cover surfaces that touch the main frame that they are attached to. As far as I could see the SWR mods have been applied. There are bonding strips soldered to the various locations that have been mentioned in previous posts. I am considering drilling a small hole in the frame and tapping it so I can use a small screw to make the ground connection a bit more secure. Will do this as soon as I locate a small enough screw, either self-tapping or threaded.
I will also install a resistor in the fan ground circuit to keep the fans running on VHF and UHF.
Right now when I turn the rig on, the fans don't come on when I am on HF, but they come on at slow speed after a bit, I presume there is a thermal switch in the circuit as they will come on after the rig sits for a while and warms up. They always come on full speed when the PTT button is pushed.
Someone debated if it was wise to take the measures advocated in previous post and I thought I might remind folk that even when we built our own home brew rigs, it was advised to use copper finger strips around the edges of cabinet openings to prevent RF leaks and also to isolate various stages, so I agree, if it works, do it!
One additional suggestion though: I looked at the small holes for ventilation in the top and bottom covers, and I think it would be a good idea to take a vacuum cleaner to them and lightly clean them and the fans as this is about the only way the air can get to the innards. We are concerned about heat and if the holes are plugged by dust all our work is for nothing!

A quick run through the Yahoo 706 list shows...
-a drill hole remove baffle mic mod for the HM103 mike (tiny
audio)... sound familiar?
-cronic issues with a power spike when you think you are running
low power (damage an amp?)
-issues with low SSB output, and a resistor mod from ICOM
-cronic birdie on 10m
-cronic complaints about the noise blanker
-cronic complaints about a swishing noise when tuning
-cronic intermod on VHF
-a bunch of people with oscilation problems on 17m, fixed by
better internal grounding, bending metal fingers and tightening
screws (sound familiar)?
-sporadic reliability, rig failure issues (inoperable with remote
cable, rig won't shut off, thermal shutdown, finals smoking, 2m
receive gone)
-an argument with Icom that their mic schematic doesn't match what
is actually in the mic...

Yep. Yaesu had some quality issues with this rig in the begining. I
was aware of all of these before I bought my 100D in November. I,
however,
...was going to put _something_ HF in my car.
...owned a 706 and didn't like it
...didn't want to bolt my Omni VI to the glove compartment door

Regardless of which side you fall, there are risks, and there will be
those that run into problems. The 100D isn't perfect, neither is the
706. For me, I liked the 100D. All I know is, I'm having a ball...
Starting to wish my commute was longer than 45 minutes.

In the log this week, all mobile: H7DX, 4Z5IW, KH7R, TI9M (two bands), 7X4AN, UK9AA, 9K2OD, OA4SS... I'll get BX5AA in the log if it kills me.

Enjoy,

Bill

Check the voltage at the radio. If it gets below a certain
value the synthesizer can go nuts (Hi-Tech term for FM'ing).

Also, check for magpies on the yagi. It happens a lot here. The woman over the back fence feeds them every day and they sit on my tribander waiting for her to come out of her house with food. I use the rotator to dislodge them. It helps to eliminate chirp.

Date: 2002-03-07 00:14:36 UTC
From: John McClain
Topic: 12748  Message: 12748

I just got to thinking that since I don't use my FT-100 for either VHF or UHF, wouldn't it be smart to remove power to that final and not have to worry about that expensive thing going up in smoke? Someday when I sell it I can connect it back up again. I don't have a Service Manual so could someone tell me which wire I should unsolder?

1st mistake, asking anyone there at Yaesu for their opinion.

Secondly, a good SWR match is the best protection for the finals.

Thirdly the FC20 stinks and the SGC or LDG are much better tuners
for the money.

If you have an FC20, use it to prop your rig up and nothing more..
Its lucky if it will match a resonant antenna as its very picky on
what it does match. Its main purpose is to touch up resonant
antennas. The LDG and SGC will make most antennas that are out of the
desired band work on the band you want with some limitations and for
less or slightly more money (depending on which model/power output
etc..you pick) than the FC20. Regards.. Richy N2ZD

Also, check for magpies on the yagi. It happens a lot here. The woman over
the back fence feeds them every day and they sit on my tribander waiting
for her to come out of her house with food. I use the rotator to dislodge
them. It helps to eliminate chirp.

A much better method is to cut a hole the same size of one of the rear fans in the case directly above the V/U final and move a rear fan to that location, or even add a 3rd fan with the added one above the V/U final to pull fresh air in while the 2 rear fans are pulling hot air out. I did the first method after replacing my V/U finals and so far it works great when my fans turn on now in V/U receive they are not on as long as with the stock fan configuration.

Bill,
I have been thinking the same thing. Why not glue it to out put transistor like they do computer 3d video cards. I dont see how it could hurt. I have a Ft100 and FT 100d. Moded the Ft100 (Resitor fan mod) Bought used. No problems what so ever. Liked it well enough to buy new Ft100d ( it had SWR mode I install fan mod) I do Think Yaesu has evaded the problem. To many post on the subject. Any how I want insurance so I moded mine. I will take a look and see what I get into on my FT100 about heat sink. Also someone said 9v olt regulator gets hot in receive causing poor sensitivity. Mine is ok but want to check it also. Will let group know what i get into.

There is a remote for the ATAS made by amcom, also check with w4rt as they have some stuff also. The remote box will allow you to tune the atas seperate from the radio for example using the atas with another radio say an Icom..

Please disregard any delay in my message posts as they must go thru 17 steps of approval before they are posted. Political correctness has gotten the best of this group and I seem to be the whipping boy. Its truly getting to the point of obsurdity as one of my posts never made it here and the other was deemed a message of "personal nature". Quite often it takes 8-10 hours before I see my message posted. A discourtesy to those who had asked a question and are awaiting a reply and silly as we are all grown men and women here.. Regards.. First, I must say I have NO experience with this device, never used one, am not suggesting you buy one, etc.

Am Com (www.amcominc.com) offers a "remote" for the ATAS100. It appears to be two boxes, one is the control head and the other goes into the feedline. It supplies the DC voltages on the feedline to lengthen or shorten the antenna. You have to listen for minimum SWR using your transceiver. No RF and no "auto" tuning that I can see.

Check out the device on the Am Com website and see if it fits what you expect.

# 12756. Re: [FT100] 2 Queries FC20 and swr mod

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-07 01:59:14 UTC
From: John McClain
Topic: 12733  Message: 12756

I am not familiar with the other tuners that compete with the FC-20 but I can say that I am very happy with the FC-20 except for that fact that it is slow. It may take 15-20 seconds to complete a tuning operation. This seems a little slow to me since it uses relays to switch L and C in and out of the circuit. I have used mine to match a 3 to 1 SWR with no problem. I have no doubt that mine saved my finals but now that my antennas are properly tuned, I really don't need mine any more. I don't think that you can go wrong buying a FC-20 but one of the others that are available may very well be better for you so do a lot of research.

I wonder how many out there are using the FC20 with their Ft100. Yaesu tech recommended it as good protection for finals. Opinions.

Second, I know about the fan mod and mike mod but what is the swr mod and how is it done?

Tks,
Gerry

Cliff,

I made an interesting observation that may help you save your finals. My fans only came on during and immediately after I transmitted when I had it mounted in my car, but when I had it (never been modified) in the house running off my Astron 30A supply, the fans came on when the rig was simply receiving. I looked at the voltage setting on the Astron and realized it was cranked up to 14.85 volts. In the car, it sees only about 12.5 to 13.5 volts, so I cranked the voltage down on the Astron. Now the fans only kick on during and immediately after transmitting, just like in the car. I have the rig remotely mounted in my car trunk where it can regularly hit 100F+ degrees in southern Texas and it has worked flawlessly for nearly 2 years. Maybe your voltage is a bit high if the fans are kicking on under receive.

Good luck,
Bob K5WA

Hello group, This morning I turned on the FT-100 and went off to have breakfast. After about half an hour I smelled something chemical burning. I traced it to the shack, where the FT-100's fan was on low speed. The radio was not transmitting and the case was very hot. I turned the radio off and allowed it to cool. When I tried to transmit after that, it did not work at all. Any ideas? Tom VE6TRM

Any folded or carved aluminum or copper that sticks up in the air (and copper would be better than aluminum, the thicker the better) flow should help considerably. It should contact the flange surfaces where the screws are (would need longer screws) and probably gently touch the top of the case. Probably a bit of heat sink grease (minimal at the flanges, more over the case) would be a benefit.

Though, is it the PA transistor or its bias circuit that blows the VHF/UHF PA? FETs aren't supposed to be subject to thermal run away like bipolar transistors...

> other digital modes.

The modern digital modes use the computer for DSP filtering so it's unlikely you'll lose anything by having the whole audio signal available to the PC. The biggest issue with digital modes, especially the narrow ones like PSK31, is that if you don't apply the filtering before the AGC, a wide and powerful adjacent digital mode like PACTOR or RTTY is likely to wipe out the narrow little PSK signal all together. So there will always be an advantage to using a ceramic filter to isolate a weak, narrow signal.

DSPs aren't fast enough to work much above audio frequencies so just about all DSP processing in ham radios takes place after the IF stage. Some radios take credit for doing DSP in the IF stage, but you'll notice that the last IF stage isn't very high which is what makes that possible.

When the CPUs in PCs got fast enough, the audio DSP software for ham radio really took off. Prior to that you had to buy a kind of developers board with a DSP chip on it and download the code to it.

To all,

Considering the VHF/UHF PA stage has no feedback on
it, I would be reluctant to put a heat sink on top of
the PA MOSFET for fear of changing the stray C in the
circuit and inducing the PA into oscillation.

What do you think Mike?

This is an important question. Many people seem to think that the fans being off during V/U receive is the cause of the problem, but I don't think this is the true. The temperature rise in the case is only about 30F with the fans off during receive. The output transistor is likely to be no warmer than the case in that condition. However, during transmit, that transistor is probably dissipating as much as 50% of the output power so that's when it gets really hot. Yet, most people who have experienced a failure of the output transistor have reported it occured during receive mode.

Of course, after the failure, the transistor is shorted and draws many amps of current and this causes lots of heat so people think of the fans being off, the case being hot, and the output blown as all being related in a kind of chain reaction. I contend that the blown transistor is the cause of the heat, not the effect of it.

It would be nice to find the root cause of the blown final because it doesn't seem to be related to heat buildup in the case. Also, it also seems that people have only reported the V/U transistor being blown, not the HF transistor. Since the SWR problem is primarily related to the HF portion of the rig, that doesn't seem to correlate with a blown V/U output transistor either.

Anyone familiar with FET output final failure modes care to jump in and offer any wisdom?

# 12769. Diamond in the rough

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-07 20:00:21 UTC
From: backhoefade
Topic: 12662  Message: 12769

Take a look at the 3rd order intercept points and adjacent channel blocking characteristics of the FT-100D and the ICOM 706 in the QST product reviews at the ARRL website and you will see the huge difference in strong signal handling ability of the Yaesu over the ICOM. On one of the bands the difference in the 3rd order intercept is nearly 25 dB. That means that for the same input signal level to each rig the 3rd order IMD will be 2x25 = 50 dB down further on the Yaesu as compared to the ICOM. This was achieved in part by sacrificing a bit of MDS (Minimum Discernible Signal) in the Yaesu, i.e. slightly higher noise figure. But on the HF bands the noise floor of your receiving system is generally dominated by external noise sources and various interferers rather than the kTB of the receiver itself (i.e. -173.98 dBm / Hz + 10log(receiver effective noise bandwidth) + noise figure. So the trade-off of a slightly higher noise figure in the FT-100D for a huge improvement in front end overload performance is appropriate. The Yaesu guys were thinking about the practical application of the rig while the ICOM guys' marching orders were apparently just "design for MDS", which was a fundamental mistake. The FT-100D rates as a "competition grade" receiver which will survive a typical Field Day "battle-field spectral" environment. The ICOM will generate gobs of cross-modulation. ICOM - you blew it.

Also, the ICOM DSP lacks the essential variable bandpass filter capability of the FT-100D which is especially helpful for CW afficionados. It is excellent. How someone would put DSP into a receiver and leave out variable BPF mode is beyond comprehension. That's just plain dumb.

Do I have to mention the noise blanker in the FT-100D? I don't think so. Do I have to mention the fact that you can receive well above 480 MHz which lets you monitor crucial public service activities during a disaster? I don't think so.

Do I have to mention that the rig has 3 basic flaws that need correction in order to enjoy the great rig. Yes. They are:
1) Internal grounding to eliminate spurious oscillation.
2) Fan mod
3) Mic mod

Once you've cleaned up the rough edges then this diamond of a rig really shines. So, unfortunately, if you want the superior performer then you have to make those mods. If you want a literally second-rate radio in terms of performance then you're reading the wrong bulletin board.

From: Dr. Gerald N. Johnson, electrical engine
Topic: 12744  Message: 12770

The temperature of the VHF/UHF PA in receive may depend on its biasing. One would think that it would be biased off, unless it IS the receiver RF stage (a dandy way to achieve dynamic range). With that stage biased off until time to transmit there shouldn't be any chance of it oscillating or heating. The PA interstage and output matching in the V shaped dangling wires, looks like an oscillation disaster in the making. Running other wires near them (like thermostat wires) can lead to odd feedback paths that are different in each radio and different according to the position of the smaller wires as they are moved by the air flow through the radio.

Often a class AB stage is biased to dissipate as much power with no signal as it will with maximum signal because in most active devices that leads to the least intermod distortion in the stage. So if the V/U PA is sitting there on receive biased for instant transmit, it will be dissipating significant power. And will also be biased for the MAXIMUM gain to be most susceptible to oscillation with the least positive feedback. And if not loaded by the antenna such an oscillation will almost surely cause excess voltage on the drain within the first cycle or two of full power oscillation to cause FET failure by overvoltage on the drain. RF plus DC. Once the drain punches through the transistor is shorted. This would be a difficult event to monitor because failure may happen in picoseconds.

For the price of a factory repair out of warrantee, the solution may be to acquire external brick amplifiers, add a bit of band detect logic, to select the appropriate amplifier and then patch around the V/U PA circuit.

I'm looking at the possibility of substituting a somewhat larger fan in place of the two mini-fans which make so much noise. The idea would be to somehow attach a roughly 2.5 inch 'tall' fan onto the back of the rig ala that new 75 Watt 2 meter VHF mobile rig which ICOM or Kenwood just introduced. If I can find a way to push the same CFM (or more) through the rig relatively quietly I'll try it. Might have to have the guys in the machine shop fashion a custom cowling for it.

When Cerritos adds a thermal switch, they plop it on top the VHU/UHF PA
and run its wires practically mixed in with the bent wire tank circuit.
Probably a grounded heat sink would improve the stability of the stage
by shielding output from input thus reducing the stray C.

Since I don't have a Service Manual, would someone take a look at theirs and tell me what wire I should disconnect to remove the supply voltage from the V/U PA? I don't use these bands and I thought that I would remove the chance that the expensive V/U PA would self destruct.

Is this in VHF/UHF tx or on hf that it will not tx ? If is in vhf/uhf tx then it sounds like the gate punch thru problem where the v/u final is shorted drains to gates, it most likely will be drawing about 10 to 12 amps while in receive if this is the case. It seems that the device is overbiased, I have measured 9 volts Vgs on the V/U final which is at the maximum range for that device at 25 C, above 25 C and the Vgs should be operated closer to 6 to 7 volts. Unfortunately the bias pot arrangement on the V/U final has a limited control range of 8.7 to 9.0 volts. Which means even if you replace the final it has a good chance of dying again.

Most of the TMOS fet problems were caused by metal migration from excessive die hotspotting which could be caused by poor heatsinking and or operating at higher bias settings along with bias shif problems. In a lot of the TMOS fets a Vgs shift of up to 30% was not unusual even after short periods of operation especially at higher bias settings like the Ft100 V/U final uses. The shift would result in the Drain idle current increasing in a direct proportion to the Vgs drift. This was a common problem in the Motorola and other MFG. TMOS and earlier type of RF power FETs. This would lead to poor VSWR immunity, gate punch thru at turn on when even small voltage spikes could appear on the drain. It's probably a combination of degredation over time along with voltage spikes that under normal conditions wouldn't hurt the device.

Anthony,
The DSP does function through the 1200 baud Data jack for PSK and other digital modes using the SSB mode rather then digital. Using SSB is the wisest choice on the SC digital modes because the filtering is tigthter through Digital on the FT 100.

# 12782. Re: [FT100] Heatsink on VHF/HF final?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-07 20:10:09 UTC
From: Mike May
Topic: 12744  Message: 12782

Any small sink attached to the top of that final isn't going to do much good as the major die hotspot is still on the bottom flange center, basically the existing heatsink is just to small and the radio needs better airflow with a method such as one fan pulling air in and another pulling air out. That's the reason that I put a fan directly above the finals, added feedback to the stage and lowered the bias voltage. Which brings up another point, the crank up the bias method whereby a MFG. will set Idq at a high level is an old trick to operate the transistor in or near compression and thereby try to obtain every possible watt of overhead without having to tune a wideband stage to compensate for differences in out Z of the devices, the only problem is the die gets various hotspoting throughout it which leads to metal migration problems which later leads to early failure, lowered VSWR handling capability down the road, also there are the Vgs drift problems at high bias levels which was a major problem and still is with the Motorola/MaCom TMOS power FETs and fact this was a larger problem in the fets than was thermal runaway in bipolar power devices.

# 12783. Blown V/U output transistor

Yahoo group: FT100 (2002-01 — 2002-06)

> much power with no
> signal as it will with maximum signal ...

The power consumption on transmit is more than 2 times the RF output power which means that the components inside the rig are dissipating even more power in the form of heat than the amount going out the antenna in the form of RF. This is normal by the way, all rigs have similar inefficiencies.

When the output is 100W, the power consumption is over 240W. Therefore, around 140W of heat needs to be disposed of during transmit. This is about 10x the power consumed on receive so I don't think the output transistors are dissipating much power during receive. Otherwise, the receive power consumption would be much higher.

In looking around for components that could be dissipating this heat during transmit, the output transistor is the most likely suspect as all the other components in the output path are capacitors and transformers.

When you consider that the output transistors are capable of dissipating such enormous amounts of power (and thus heat), it seems unlikely that they'd be damaged by heat while just sitting there during receive. I would think that somehow the transistor gets damaged first and only then begins to consume large amounts of current. According to some reports, the amount is about 11A which is nearly 10A above the normal receive current. This means that the transistor is dissipating over 100W of power while it's shorted. The V/U transistor is only rated for 50W maximum. Does the transistor short out due to heat or does it short out first and then produce the heat? I contend that it shorts out first and the heat comes later.

What would cause the V/U transistor to short? Perhaps a manufacturing defect is responsible. Or, there could be some damage caused by excessive heat during

transmit due to a poor SWR which prematurely damages the transistor. It could also be a punch through from a static discharge. At one time, flux left on the board was thought to be the cause, but it's hard to understand this phenomena unless the flux was conductive (which is unlikely). I really think that no one really knows the cause yet.

If you know the root cause of the problem, please jump in now. It seems that we've had a number of list members report a blown V/U final in the past few months and it would be good to get to the bottom of it.

# 12784. V/U finals

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-08 04:11:33 UTC
From: k5unm
Topic: 12784  Message: 12784

Researching the service manual reveals that the bias voltage regulator Q3506 on the PA board is controlled by Q7010 control microprocessor (UPD78P4038GC-BBT) on the Control board. Since Q3506 (PQ09TZ1U) is a Sharp 4 terminal regulator with on/off control the Bias voltage is off unless the FT100 is in transmit. Not only is the Q3505 (SRF7043) finals controlled but all of the bias string for Q3501 MRF581, Q3502 MRF559, Q3503 MRF555 and Q3504 MRF5015 controlled by the same regulator. Q3501 thru Q3505 form the V/U power amplifier chain prior to the antenna switching circuits (relays) on the LPF unit. This would imply that during receive the PA section is not dissipating any power unless Q3506 is latched on or defective. Additionally the probable failure mechanism is transients on the 13.8vdc line since the finals do have that voltage present the entire time the radio is powered. The regulator Q3506 has protective diodes to prevent bias voltage from remaining applied if primary power suddenly is removed, i.e. radio is keyed and loss of input voltage occurs.
Additionally this scheme is also used on the HF finals with Q3001, the same Sharp device, controling the idle current on the Q3007/8 MRF255, Q3004 MRF5015, and Q3002 MRF9745 the HF power amplifier chain.
Another interesting item is that ther are two control transistors for the cooling Fans, one is directly controlled by the HFtx and VUtx signals (Q3507) the second by the control processor. The second control is the slow fan speed since it has a 39ohm resistor in series with the collector lead of Q3003. The temperature sense thermistor for V/U is TH3001 located on the circuit board by the SRF7043 output. Not very conducive to getting heatsink temperature.

# 12785. Re: [FT100] Blown V/U output transistor

I have found flux that was conductive during high humidity conditions. That was in a 1200 baud modem that cost more than the FT-100D and probably 15 years ago. When the boys in the weather office left the windows open on a near foggy night, these modems would not function (CMOS logic) the next day. After a couple annual trips to the factory (which Yaesu has copied for service charge rates), I found the excess flux, cleaned it off and the modems ran several more years without failure until their speed was supplanted by $90 2400 baud modems.

Flux around an RF circuit should not be a problem because the circuit impedances need to be low, even the bias circuit, especially the bias circuit.

The hot spotting and metal migration that Mike talks about is logical. The heat sink I was thinking about would need to intersect a lot of air to be effective and it would depend on the thermal conductivity of the base flange to move the heat from the die to the ends of the flange and then a copper heat sink on top the transistor might help. It might be of benefit to lift the transistor from its existing heat sink and add a slab (say 1/8") of copper as a heat spreader to improve the conductivity along the length of the slab. This would not be practical if the gate and drain tabs were soldered directly to board traces or had chip or ulenco metal cased mica capacitors connected directly to them, except maybe when the transistor was being replaced. Then changing the length of leads would probably mess up UHF operation.

If the transistor fails while there is no bias (and shutting of the series bias regulator lets the voltage fall due to a low resistance from gate to ground), it can't be heat from that time period, and it can't be a parasitic oscillation, so the things Mike discusses seem likely. If that is the case, then it appears that all transistors in this application are doomed to fail. That is not good news.

As for losses, capacitors with lots of current do dissipate energy, as do transformers at VHF/UHF. Wires dissipate energy, poorly designed resonant circuits (unshielded and with conductors spaced significant distances from the ground plane) radiate energy.

From: hfolgering
Topic: 12744  Message: 12786

My observation has been that the PA board,just like the LPF board is
very poorly grounded on the component side.
The only place were the ground foil is connected to the aluminum frame
of the rig is at the left lower corner mounting hole (as seen from
underneath)and even there the screw head barely touches the copper on
the board since the copper does not even come close to the hole.
In this spot I have put a star washer under this screw,around the
other mounting holes I have scraped the laquer off and tinned the
copper groud foil in order to provide a good RF ground and I have
added a ground strap from the centre rib to the ground of coax
connector J3001.And of course done the fan mod.
Hope this wil keep things from blowing!!

Hi Mike, The same goes to my FT100, and it is still resting in my shack doing nothing. I am sure there is somebody out there who can design or fabricate something to solve this problem. There are simple components in the market which can be used to achieve the 50W output for the final. I am sure there are people who is willing to pay for this kind of initiative. I am sure I'll be the first to buy. So what do you suggest as a remedy to improve life time? Reduce bias somewhat? Then you have a linearity issue, at least with SSB and AM, correct? Maybe best to just leave it alone. Is it possible that running at, say, half the max power output rating would help matters? Run about 25 Watts on 2 meters and 10 Watts on 440 MHz? What do you think? Thanks.

What I have done, in my case, is reduce the power output to roughly 70% of maximum on both VHF and UHF. Also reduced power to 85% on 6M and HF. At least I can cut the heat load/generation a bit during transmit.

# 12790. FT-100D - menu access ques.

Topic: 12790  Message: 12790

Hi all....I'm hoping that this isn't an incredibly stupid or hashed over issue but here it is. I have a new FT-100D (Jan 02). I seem to have locked myself into something that even a CPU reset didn't seem to fix. To access the menu subsystem, you should hit the function key and hold for 1/2 sec. Then rotate the large dial knob to select which function you wish to alter. I believe that you then hit the function key again to get to the actual setting. When I do this, I am immediately put into the setting for whatever was selected by the last Function button (i.e. Func - TON) will send me into that menu function and all rotating the large tuning knob will let me select which PL to use. I cannot seem to get into a mode where I can select other menu items (i.e. VHF TX Power). Anyone have this happen?

Thanks,
Chuck / W3YNI

I apologize if this has been answered before---but has anyone suffered a VHF/UHF final failure who has NEVER used his FT-100 mobile? I know many people are using the rig strictly on a home power supply. Have any of those radios ended up with fried finals?

Chuck
I think you misread the instructions a little.

Press and hold the Function Button for ½ Second and then release it. Rotate the SELECT knob to select or view the menu items (1 through 66) you wish to change or observe, or whatever you wish. You rotate the TUNE knob to make the changes, (more power or less power etc.) When you are done or satisfied, press and hold the Function Button for ½ second and then release it. You will then be returned to the frequency and mode you were using before this, but any changes you have made will be done but only them. If the changes you wanted to effect don't affect the band you were tuned to before you went to the menu functions you wont see the change until you are operating in the mode or band the changes were modified for.

Hope this helps, I am not too good at describing this but hope you get the idea.

Einar VE7BAQ (FT-100D)

No the SELECT Knob (lower left knob on the face) That canges the menu functions and the MAIN Knob (VFO) that changes the settings of each functions. ALSO mak sure that the lock button has not been pushed prior to adjusting the MAIN dial. If it has the settings will not change until it is pushed again.
73 and I hope this clears it all up for you,

Yes, my VHF/UHF finals fried in base station use on a regulated power supply on a brand new radio that had never been mobile. In fact, the VHF/UHF side had never been used and they fried the first time I keyed up the UHF side. Go figure. Glad mine was still under warranty by 2 weeks.

The large (MAIN DIAL) tuning knob adjusts the setting you have selected. To get to the other menu items, use the SELECT knob (bottom left of front panel). See page 82 of the manual. It's always easy once you figure it out!! Good luck and enjoy the new radio.

Grant,
ZL2BK.

# 12796. No Power meter on UHF transmit

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-09 03:25:36 UTC
From: maxjam_99
Topic: 12796  Message: 12796

I noticed to day that when I am transmitting on UHF the front display doesn't show any TX power. I measured it with my meter and found that it is indeed transmitting 35W and reflected is under 1.5:1. All bands are functioning properly and display the proper power out on TX. Only UHF doesn't but yet otherwise is functioning properly. Any ideas?

Thanks.

Ths post has me worried. I have never had my FT-100 on UHF/VHF. I do not even have an antenna connected to the U/V connector. Looks like I need to hook up an antenna and try it a few times before my warrantee runs out.

# 12800. Still frustrated, but had a good surprise along the way.

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-09 16:11:42 UTC
From: P. J. Kerrigan
Topic: 12800  Message: 12800

It seemed like the radio, which was freshly back from Cerritos, had low (60% indicated) output power at HF & 6m. Tested this with a dummy load in the car.
I e-mailed Yaesu USA about this, and much to my surprise, got a call from a real live person, who looked up and read me off my alignment report.
One of those "worked fine on the bench" things. He did offer to fax over the power output alignment procedure from the service manual.
I figured I better do some first-things-first before opening & tweaking the radio - tightening up the power & grounding.

I ordered an OEM FT-100 connector from PowerWerx.com, removed the Yaesu supplied power cable & fuses, put the connector on
the #10 cable back to the battery. I put in some test points for attaching a voltmeter to test under load. Car puts out 13.4 volts when running, so that part is fine.

Strapped everything down with 1" copper tape instead of copper braid from RG-8.
I'd like to try checking the impedances of the grounding connections at 29 & 50 Mhz if I can get my hands on an RF impedance bridge and signal generator.
Looking for suggestions from people here if this is productive, and some ideas on procedure if somebody's actually done it.

It's not all bad - I was able to get good 6m SWR & signal reports (albeit at 30W) on FM & SSB with a Hamstick (tuned a bit). Just have to pick what half of 6m I want to work.
Same with a 10m hamstick.
Just looking for the holy grail of having the ATAS-100 work on all the frequencies it's supposed to.

Thanks to Richy, Ian Moth, John McClain, Sandor and backhoefade for the suggestions so far. Looking forward to possibly hearing you on the air once this is all done.

Peter

"Mine too" is an awfully wide target grouping to study statistically.
Also might help limit anxiety levels...

I also think that it might also help if rig owners mentioned if it is an FT-100 or an FT-100D. This will narrow the field of speculation to readers, you know like "Mine is a FT-100," or, "Mine is a FT-100D." Seems like everyone just says FT-100. Just a thought.

A much better method is to cut a hole the same size of one of the rear fans in the case directly above the V/U final and move a rear fan to that location, or even add a 3rd fan with the added one above the V/U final to pull fresh air in while the 2 rear fans are pulling hot air out. I did the first method after replacing my V/U finals and so far it works great when my fans turn on now in V/U receive they are not on as long as with the stock fan configuration.

Thanks for the comment. It does seem that FT100 is
used to indentity both. That leaves a big question
sometimes.

Robert I have both radios and like them. The auto
tune feature in the FT100D used with the Atas-100
antenna works great on all bands from 40m-6m. Great
for mobile use.

# 12813. Explorer Sport Trac 2002

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-10 14:06:25 UTC
From: wb5zam
Topic: 12813  Message: 12813

I have seen mounting suggestions for the antennas for the older Explorers, but here is a new problem. The new Sport Trac has a ruber bed, with a few screw down points actually tied into the bed. Without putting a mast or plate up from the frame, between the cab and bed of the SUV, does anyone have any ideas on antenna mounts? I have a Tonneau cover on mine, and am tempted to create a ground plane with a grid under the lid, and a mount thru the center of the lid, but really hate to drill holes anywhere visible (I did that with prior autos and the trade-in dealers were rather miffed at the patched or plugged holes).
Just found this site and lots of good info. Thanks for everyones info and time to answer all the rest of the stuff on the rig and the antenna installations.
Bill

From: signup
Topic: 12805  Message: 12814

While the radios are comparable, there is no comparison .. the IC-706MkIIG is a superior radio.

1. The 100-series have had more production problems than the 706-series,
2. The 706 menus are easier to navigate,
3. The 706 is rated 100% duty cycle, the 100 is rated at 50% duty cycle,
4. You get superior tech support by phone and email from ICOM than you do Yaesu,
5. If you shop around you can get the Icom for less than Yaesu.

I own both ... the FT-100 is a paper weight since the finals went out using it mobile on their ATAS-100. They wanted $ 550.00 to replace the final PA with a 30-day warranty. That is when I bought the Icom for $ 250 more with a 1-year warranty. Except for the auto-tune feature of the Yaesu on the ATAS, I haven't missed and have enjoyed the Icom a lot more.

# 12818. FT-100 with excessive SWR

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-10 21:02:03 UTC
From: n8uvq@juno.com
Topic: 12818  Message: 12818

Looks like my FT-100 needs to return home to Cerritos. On ten meters through a tuner into a dummy load the high SWR icon appears. I can not adjust the SWR via the tuner, even when the power setting is on 5 (~5 watts).
The tuner and associated cables test good with a VOM. If I switch to an older Kenwood rig or a friend's FT-817 and keep everything else the same, I can adjust the SWR. Doesn't look like my tuner or cable is the problem.
Never attempted adjusting with an antenna connected.

Signal strength of a local 2 meter repeater (~4 miles away) & NWS decrease as
the rig heats up. Yes, the fans do not run. Usually I use the rig for HF, but I
feel this also needs addressed by Yaesu.

Fortunately, it's under warranty. My FT-100 was purchased in June 2001. Its
serial number is 9J100xxx. What is the average turn around time for warranty
repairs? Has anyone some pointers to possibly accelerate the process? Should
I ask them to do all the mods and updates? Or do they do the mods & updates without
asking?

FT-100D is just an option package. There are no engineering differences except a larger speaker and a few options installed. So the "Mine's a D" distinction is really rather meaningless

I notice that on of the connections for this cable is called squelch status.

I assume it is either high or low when the squelch is open??

If it pulls low, what sort of a load can it sink, it it pulls high what level does it go to ???

Thanks
Andy

From: backhoefade
Topic: 12805  Message: 12823

The spurious oscillation mod is a bit tricky to do yourself so I would recommend sending it to the Cerritos repair center. If you mess it up you will void your warranty. But if you want to try to do it yourself a couple people have posted detailed info on it here. Plus there are some good photos showing the mod in the photo gallery.

The fan mod is also probably best done by Yaesu. They install a temperature sensitive switch on the final amps (VHF/UHF) so the fans will turn on during long receive sessions. The alternative approach is to install a 68 ohm (approx.) resistor between one of the black fan wires and the chassis ground. That will keep the fan running at all times during receive. But again, I think if you somehow mess the rig up you will be hard pressed to get Yaesua to back their warranty.

The mic mod is the one mod that the user must do. Yaesu doesn't perform that mod but it's very worthwhile. It will make your transmit audio just super.

So you're faced with the basic dilemma that I summarized in my earlier message. I would suggest sending it into Yaesu but that's a pain because you will lose the rig for something like 8 weeks.

# 12824. Curiosity ?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-11 04:51:27 UTC
From: kc2gkl
Topic: 12824  Message: 12824

Greetings....

Seeing that this is a very active group and after taking time to go through many of the posts here I feel I must ask this question to satisfy my personal curiosity. "How many own an FT-100(D) and have never experienced a problem with it"? "Does such an animal really exist"?

I only ask this because it appears as if every other day or so there is a post about some type of problem, i.e. failing finals, SWR problems, poor TX audio, overheating, etc, etc. Minded, if an individual is going to drop a good chunk of change to own this rig, does it really make sense to have to crack open the covers on it and perform modifications just so the radio operates as it should of originally intended to? Personally, that seems very ridiculous.

The radio may indeed be a diamond in the rough as one poster exclaimed, however, for that amount of money, I think one would expect flawless performance from day one, or am I missing something here? Perhaps the number of problems are actually very small compared to the relatively large number of FT-100(D)s out there in the field?

Can someone please shed some light on this subject for me? Many thanks in advance for any insight which may help to ease my rattled nerves.....

73
Gary

Hi Gary;
I am one of those animals that haven't had a single problem with the
FT100D+ATAS100 having used it since two years in the mobile.
Also, according to the polls it is a very reliable rig according to
the user's oppinion.
good contacts,

For me the choice was easy I did the mods before having any problems (for me thats fun) and when I compared it to the only other radio that really competes with it (706) the ft-100 wins hands down, this is only my oppinion and hopefully others too.I do have to admit yaseu's service on phone calls and everything else from reading this group could is worse than microsoft. The only radio I like better is my FT-817

From: n9cv
Topic: 12805  Message: 12827

If you do not choose to send in your new radio to Yaesu until it fails, at least install the fan mod resistor.

It is a simple 10 minute install and could be removed later if you send the radio to Yeasu. Get a 39, 50, or 68 ohm resistor (your choice). Stick one end in the black fan wire plug. Ground the other end. The ground side on mine is connected under the cover screw. You are done.

TO REMOVE, simply remove the cover and pull the resistor out of the fan wire plug. The size of the resistor determines the fan speed. Higher value resistor equals slower speed.

I strongly suggest you send the radio to Yeasu for both mods.

Mine is a FT-100D (I forgot the serial numer) purchased in June 2001. It failed within 2 months of mobile operation. I sent it in to California for repair and a 3 month vacation. Yeasu installed the mods when they fixed the other problems. I understand their turn around time has improved since then.

I now love this unit as a mobile rig. I have done side by side conparisons with the Icom 706. The FT-100 beats it hands down on HF. I have no experiece with either radio on VHF/UHF.

Thanks for the kudos, anyway, they probably dropped the power on it as several have been reported to have lower output on return from Cerritos. I always ran mine less than 100 watts anyway. If you want to work me, give me a few days to mount the TSB2000 in my new car and I would be happy to.. :-) I couldnt resist getting one for the price and the fact that the rc2000 control head came with it. Running it in the shack as we speak... er... Type.. I am somewhat leary about the car I am putting it in. Its a new Honda Insight Hybrid and so far the manual says its ok to put a 2 way radio in it. I may run it at 50 watts to be safe as the car does have several computers in it and not much of a battery (12v) under the hood (looks like a golf cart battery) . The second caveat is that the car is all aluminum. No mag mounts for me!
I am looking underneath to find an acceptable place to mount a tongue for my atas and make up some wacky mount for my dual band antenna. Good Luck with the freshly returned radio.. Regards.. Richy N2ZD

This sounds like a bad microphone or microphone cable. Do you have another microphone you can borrow to try?

I looked in the Yaesu FT-100D Operating manual. Page 4 has the pin outs for the microphone connector. Unfortunately I do not see the PTT line listed in the picture. PTT (Push To Talk) must be done digitally rather than grounding a lead. Maybe someone else can better explain because I am not sure how this works.

The picture on page 4 shows connector in the front of radio with the key at the bottom of the connector. The pins from left to right are listed as: SW1, MIC IN, Ground, +9v, N.C., and SW2.

I hope this helps. Do not worry about your English. It definately is better than my Portugese. I do not know a single Portugese word.

Subject: [FT100] Curiosity ?

Greetings....

Seeing that this is a very active group and after taking time to go through many of the posts here I feel I must ask this question to satisfy my personal curiosity. "How many own an FT-100(D) and have never experienced a problem with it"? "Does such an animal really exist"?

I only ask this because it appears as if every other day or so there is a post about some type of problem, i.e. failing finals, SWR problems, poor TX audio, overheating, etc, etc. Minded, if an individual is going to drop a good chunk of change to own this rig, does it really make sense to have to crack open the covers on it and perform modifications just so the radio operates as it should of originally intended to? Personally, that seems very ridiculous.

The radio may indeed be a diamond in the rough as one poster exclaimed, however, for that amount of money, I think one would expect flawless performance from day one, or am I missing something here? Perhaps the number of problems are actually very small compared to the relatively large number of FT-100(D)s out there in the field?

Can someone please shed some light on this subject for me? Many thanks in advance for any insight which may help to ease my rattled nerves.....

Hi Ken and others,

seeing that the PTT has been bought up, I will give a short description of how the PTT and other buttons on the microphone work.

The easiest way is as follows:

from the SW1 line draw four resistors in series. the first is 27k, next is 39k, next is 82k and the last is 220k.

Now, from the junctions of each pair of resistors and the end of the string draw a pushbutton switch (normally open) to ground.

The first (junction of 27k and 39k) is PTT, next is DOWN, next is UP and last is ACC.

Now, although there are a couple of transistors involved in the actual circuit in the mic, you can do exactly the same from the SW2 line leaving out the 220k resistor and last push button. On this one, the first is P, the second P1 and the third is P2.

The lock switch works by breaking the ground connection to all except the PTT button. this disables all buttons except the PTT.

In my car, I have installed a boom mic for hands free operation and made up a little box with the switches which is mounted on the gear stick where I can reach it when my hand is on the stick. This box has all the switches on it and only requires 3 wires going to it to give me all button functions. I actually have a centre off button for the PTT with momentary in one direction and locking in the other. The momentary position is always operational but the locking direction is disabled by the lock switch when I lock the other buttons. I then have a piece of thin twin shielded microphone cable (about 1/8" diameter) running down the gear shift and going to a little control box which also houses the preamp I need for the microphone I use (an Icom HS15) as it's output is a bit low for the FT100D. I think that it may be because the mic is quite old. I've had it for about 10 or 12 years and it has been in several cars now. The extension lead for the microphone, which comes with the separation kit, just plugs into the control box and everything works fine. I have adjusted the preamp so the normal mic gain setting in the radio is correct so that way I don't have to change anything when I move the FT100D into my other vehicle where I don't have the boom mic and don't use the separation kit.

This whole setup is very convenient and seems to work fine on both VHF/UHF and HF where I have had several successful contacts into Europe on my way home from work over the last few days. (I am currently using a Terlin Outbacker Juniot Plus antenna but am probably going to order an ATAS-100 in

from New Zealand in a few days (they are not available in Australia, unfortunately).

I hope that the above description is of use to some of you.

My FT100D was 9 months old with no problems. But just
to play it safe I sent it back for the mods while it
was still in warranty. It's the wait to get it back
thats hard to cope with.

Gary; I've had mine (FT-100d) for about two years and used as mobile in -5 degrees F to 120 degrees F and now on the bench in the shack as a test rig against my IC706 for antenna testing. The only thing I have done to it is build a proper grounding tab off the RF output leads plus put an inline 12v filter to help reduce transients on the 12v power leads. So far so good!

From an operational point of view, I check the FT100 against my IC706 and my spy radio (Harris RF-590) and the rcvr on the FT100 is really great, once u learn how to operate it. Which leads to the manuals (supplied or not); they obviously were written by non English logic based humans residing on this planet. Compare the IC706 manual, which is very well written.

In my opinion, a new FT100 is worth about $US500.00 considering all the potential screw ups and lack of quality control by Yaesu.

Lee,

If the receiver still works in your "paperweight", I'll give you $100 for it.

Bob K5WA

>>I own both ... the FT-100 is a paper weight since the finals went out using it mobile on their ATAS-100. They wanted $
>>550.00 to replace the final PA with a 30-day warranty. That is when I bought the Icom for $ 250 more with a 1-year

I may be lucky, but I have had nary a problem with my FT-100D. I have logged over 300 contacts, 170 counties and 25 countries on 20 Meters. ALL MOBILE since January '02. I have been on VHF/UHF one time each since I installed the rig. Using a HamStick on 20 with a Larsen dual bander on V/UHF. The only problem I have encountered is being unable to get an acceptable SWR on 40 Meters when trying to tune a 40 Meter HamStick. Anyone have any clues on that?

# 12843. Re: [FT100] Heatsink on VHF/HF final?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-11 15:21:53 UTC
From: Mike May
Topic: 12744  Message: 12843

I didn't have a 3rd fan that fit very well so I changed things around a 2nd time but basically all I did was remove one fan from the rear and I then cut a hole just above the v/u final and put the removed fan in this spot with it pulling air into the radio with the remaining fan doing its original design duty of pulling air out the rear. So far after 1 week of heavy operating on VHF/UHF and HF/6 FM at full power my radio is staying cool, I'm runing 6 and 10 fm at 100 watts, VHF at 45 watts and UHF at 22 watts and in the past even with a fan circuit installed to turn the fans on in V/U receive the radio was still a getting alot hotter than it is now. The only thing about this mod is make sure that you dont place the fan so close to the edge that it interferes with the quick release bracket.

# 12844. FT-100 to FT-100D

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-12 01:20:36 UTC
From: n8uvq@juno.com
Topic: 12844  Message: 12844

I HAVE to send my FT-100 in for warranty repairs. While speaking with
a technician he suggested having the rig updated to the FT-100D version.
Has anyone on the list done this? Other than the TCXO-8 unit, and the
case & speaker change, what else is done? And the next question,
does anyone have an approximate fee for this upgrade?

As an FYI for the list, the tech said warranty repair turn around is
between
three and four weeks.

Thanks for your input.

Hi Alex,

I don't know how the 817 works in the PTT department but to operate the PTT on the FT100 you need to ground the SW1 lead through a 27K resistor.

See my previous message from yesterday for a full description on the switching in the FT100 microphones.

Subject: [FT100] New owner and PSK31

Just bought a FT-100D and am having problems getting the PSK mode to work. Using a RigBlaster Interface and the cable from my Ft-817,which looks as if it should be the same. However, the PTT does not seem to work and I never go into transmit. Receives great. Any ideas?
Thanks in advance.

# 12848. Re: FT100 rx/tx

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-12 08:58:05 UTC
From: n9cv
Topic: 12803  Message: 12848

Eric,

If I read your post correctly, to get the following functions a resistance is applied between pin 3 (ground) and pin 1 (SW1) of the microphone connector.

PTT - 27K ohms
DOWN - 66K ohms (27K + 39K)
UP - 148k ohms (27K + 39k + 82K)
ACC - 368K ohms (27k + 39K + 82K + 220K)

If this is true, then Luiz Carlos could temporarily test the PTT function of his radio by simply applying a 27K ohm resistor between pin 3 and pin 1 of the microphone connector. If the FT-100 goes into transmit with the resistor connected, the problem is in the microphone. If it does not transmit then the problem is in the radio.

Please advise me if this is correct, before we suggest it to Luiz Carlos.

On a side note, I am still willing to see if I can get you an ATAS-100 at Dayton in May. Did you see if the dealer in Auckland stocks the ATAS-100, or does it have to be ordered? Also how much does the ATAS-100 cost (plus any import tax and shipping to Australia)? If NZ is too expensive, or it is not readily available, I could call AES or one of the dealers here and see if they will ship to VK land.
I think it is crazy that Dick Smith imports the FT100, but not the ATAS-100.

# 12849. Re: Curiosity ?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-12 09:20:04 UTC
From: n9cv
Topic: 12824  Message: 12849

35 years ago I had a job repairing business machines. After 3 or 4 years of fixing these machines at various customers around the Chicago suburbs, I believed that they were all junk. I was always fixing the same machine types, but not necessarily the same physical machines.

Then one day I happened to look at the installed inventory of my clients. I realized that each client had 30 to 50 of these machines at each location and most used them 24 hours a day. I was only getting calls on one machine at a time. Most machines never had a call in years of service.

I then realized that you have to put things in perspective. When you only see or hear about broken machines, and never hear about the running ones, you soon believe that all machines of that type are junk.

I believe the same goes for radios. I will admit to some repairable / preventable shortcomings with the FT-100 and to slow response time if they are sent in for repair. But it is difficult to get a true picture of the over reliabilty of the product when you only see or hear about the broken ones.

Hi Ken,

yes, that is correct, 27K between SW1 and Gnd will make the PTT operate.

Thanks for the offer re the ATAS-100, I actually ordered one today from ZL. The price was approximatelt equivalent to what you pay for them in the US (US$320) so I am happy. I should have in in the next couple of weeks.

Thanks for keeping me in mind about it.

73....Eric.

Subject: [FT100] Re: FT100 rx/tx

Eric,

If I read your post correctly, to get the following functions a resistance is applied between pin 3 (ground) and pin 1 (SW1) of the microphone connector.

PTT - 27K ohms
DOWN - 66K ohms (27K + 39K)
UP - 148k ohms (27K + 39k + 82K)
ACC - 368K ohms (27k + 39K + 82K + 220K)

If this is true, then Luiz Carlos could temporarily test the PTT function of his radio by simply applying a 27K ohm resistor between pin 3 and pin 1 of the microphone connector. If the FT-100 goes into transmit with the resistor connected, the problem is in the microphone. If it does not transmit then the problem is in the radio.

Please advise me if this is correct, before we suggest it to Luiz Carlos.

On a side note, I am still willing to see if I can get you an ATAS-100 at Dayton in May. Did you see if the dealer in Auckland stocks the ATAS-100, or does it have to be ordered? Also how much does the ATAS-100 cost (plus any import tax and shipping to Australia)? If NZ is too expensive, or it is not readily available, I could call AES or one of the dealers here and see if they will ship to VK land.
I think it is crazy that Dick Smith imports the FT100, but not the ATAS-100.

Hi again Ken,

I wonder what sort of machines they were that you were working on. I worked along similar lines and found the same sort of result, only a small percentage of the machines provided about 95% of the calls.

Subject: [FT100] Re: Curiosity ?

35 years ago I had a job repairing business machines. After 3 or 4 years of fixing these machines at various customers around the Chicago suburbs, I believed that they were all junk. I was always fixing the same machine types, but not necessarily the same physical machines.

Then one day I happened to look at the installed inventory of my clients. I realized that each client had 30 to 50 of these machines at each location and most used them 24 hours a day. I was only getting calls on one machine at a time. Most machines never had a call in years of service.

I then realized that you have to put things in perspective. When you only see or hear about broken machines, and never hear about the running ones, you soon believe that all machines of that type are junk.

I believe the same goes for radios. I will admit to some repairable / preventable shortcomings with the FT-100 and to slow response time if they are sent in for repair. But it is difficult to get a true picture of the over reliabilty of the product when you only see or hear about the broken ones.

# 12852. ATAS Downunder

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-12 13:21:46 UTC
From: Alek Petkovic
Topic: 12852  Message: 12852

In a recent posting, someone wondered why the Australian Distributor for Yaesu is not importing the ATAS-100 mobile antenna system.

I think it is because it would probably end up being priced around $850 - $900 AUS including mounting kit or around $700 AUS for the antenna alone. This would put it right out of contention as far as sales in this country are concerned. Those estimates are conservative. The $840 you pay for the FT-100 in the US equates to about $1615 AUS. The price in Australia for the FT-100 is currently at $2000.00 AUS or $1040 US. A month or two ago, it was closer to $2500 AUS

Nobody would pay that sort of money for a toy antenna in this country.

We have several antenna manufacturers in this country who produce far better antennas at far better prices. The distributor is no doubt aware of this fact and hence has chosen not to sell and support the ATAS-100.

To all those of you who are using the ATAS, sorry about the "toy antenna" dig. It's a thing we Aussies do. Hi hi. I'm sure it's a great antenna.

73, Alek.
VK6APK

ps, As a matter of interest, I think the Icom IC-706Mk2G is still well over $3000.00 AUS here. That's why we buy Yaesu.

>HamStick. Anyone have any clues on that?

When an electricaly small antenna like a 40 meter HamStick is tuned to resonance the resulting resistance is still too low to yield an acceptable SWR. The intructions that come with the HamStick recommend adding a capacitor between the base of the antenna a ground. Check the instructions for the recommended value.

Other than the noise blanker being better in the FT100 the rx is is
pretty close on them.I put them both on the same antenna with an A/B
switch.

Subject: [FT100] New owner and PSK31

Just bought a FT-100D and am having problems getting the PSK mode to work. Using a RigBlaster Interface and the cable from my Ft-817,which looks as if it should be the same. However, the PTT does not seem to work and I never go into transmit. Receives great. Any ideas?
Thanks in advance.

# 12857. SWR Icon Question

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-12 03:31:57 UTC
From: tdc455
Topic: 12857  Message: 12857

Can't seem to find this in the manual maybe someone in the group knows the answer. When I tune up my FT-100 through the FC-20 tuner I sometimes see an SWR icon for a few seconds following the tune but it's not the SWR icon with the X. This one has the antenna symbol with an O to the lower right in place of the high SWR X. I occasionally see the SWR icon with the X when tuning on 160m. Does anyone know what the icon with the O represents?
Thanks & 73

From: backhoefade
Topic: 12824  Message: 12861

The key point is that the FT-100 / FT-100D has two inherent design flaws. It's just that simple.

The typical new owner, if he doesn't have prior exposure to this bulletin board, goes through the same phases:

1) Discovery
2) Denial
3) Rationalization
4) Repair
5) Appreciation

Guess you could call it the 5 step FT-100(D) program.
The more fortunate hams skip right past the first 3 steps and just do the repair and get on the air.

Low? What about a _high_ value?

I was helping another ham install his FT100D and ATAS on a Dodge truck last weekend, and finally had the time to put an analyzer on my ATAS, which has never loaded on 40m. I manually ran the ATAS all the way out, disconnected the pigtail, and put the analyzer on it. It was resonant at 6.80 Mhz (so it's not a whip length issue), but with an impedance above 50 ohm, almost 150 for a SWR of close to 3:1.

We tried his ATAS with the same result. I have mine installed on my luggage rack with a K550 mount and a ground strap to the rack, and I have confirmed that the rack is grounded to the chassis.

See: http://groups.yahoo.com/group/FT100/files/Mobile%
20Installations/W1PA/K550_closeup.JPG

His is installed on his hood, with a K400 clipped to the edge. His loads on 40m, not great, but it does.

Any antenna gurus think, based on these results and the impedence numbers, that I might be better off with a K400 mounted on my hatch door lip of the Subaru wagon versus the rack? My ATAS works and loads very well on _all_ other bands other than 40m... including WARC.

Regarding the mike button resistor values listed in the previous
posts, there is a clear picture of the hookup and mike connector
designation (Grd, SW1, SW2) at www.mods.dk
Also a picture of the mike jack pinouts.
Just click on Yaesu and go to FT-100.

Bill; I'm using a similar method of mounting (K9000 motor). However,
I used 1 inch strap direct from the bottom of the atas-100 to the
roof. Yes, I did drill a hole in roof and mounted a feed thru for
coax feed. Loads great. Those K type mounts are coated and u need to
get to bare metal. You might try using say 1/2inch braid strap for a
lower impedance match; the stupid antenna stops working at 3:1 vswr.

Tim,
Your question drove me nuts when I tried to get my FT-100 working with the an FC-20 and an ATAS-100. I finally called Yaesu Tech Support and was told that the SWR icon with the 'O' means that the TUN operation completed successfully with a low SWR. The 'X' means that the rig is seeing a high SWR. Yaesu could have saved me a lot of time and effort if they had thought to include this icon in the manual along with the 'X' icon.

Subject: [FT100] SWR Icon question

Can't seem to find this in the manual maybe someone in the group knows the answer. When I tune up my FT-100 through the FC-20 tuner I sometimes see an SWR icon for a few seconds following the tune but it's not the SWR icon with the X. This one has the antenna symbol with an O to the lower right in place of the high SWR X. I occasionally see the SWR icon with the X when tuning on 160m. Does anyone know what the icon with the O represents?
Thanks & 73

# 12868. Disabling the V/U PA.

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-12 18:32:50 UTC
From: John McClain
Topic: 12868  Message: 12868

I have mentioned this twice before but didn't get any response (at least none that I saw). For those of us that do not use our FT-100 on the VHF and UHF bands, wouldn't it be best to somehow disable the PA so that it wouldn't self-destruct like several people have mentioned here. Some have reported that the V/U PA went up in smoke while the rig was receiving and some even said that the it was receiving on an HF frequency when it failed. So wouldn't it be a good idea to prevent this from happening by removing the supply voltage to the PA and saving ourselves up to as much as the $505.00 that one person reported? Some day when it comes time to sell the rig, it would be a simple matter to re-enable the PA. Now is this one a winner or what?

# 12869. ATAS/HamSticks on 40M, was Re: Curiosity ?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-12 19:02:32 UTC
From: w1pa
Topic: 12824  Message: 12869

Ah, there's the rub. Since the photo was taken, I have run a ground braid (two No 8 conductors) from a large diameter spade lug that goes around the SO-239 itself, down to the same screw hole in the luggage rack that you see in the photo... a direct connection, bypassing the hinges and tilt. I really can't bring myself to drill a hole into the body, though.

That's why I was thinking of the K400, that clamps directly to the metal of the hatch. With the ATAS tied to one corner of the car, I just point the car in the direction I want maximum gain. :-)

Five years back I ran a 706 and an outbacker on a K400 3/8-24 mount on the trunk of my Toyota Corolla. _That_ would load on 40.

Read msg 12784 and it details the operation of the bias regulator.
You could cut the control wire and ground the side going to the
regulator to prevent the regulator from turning on.

Topic: 12868  Message: 12871

Since its a wire carrying 12 amps on transmit, its not a small wire, probably a wide trace on the PC board. I don't know for sure, but cutting either may not be trivial and restoration may not be easy to do without being a sore point. You probably also want to remove the gate bias, since there's some indication its running at the ragged edge for the device safety and glitches in it might be the root of the problem.

The A, B, C, D buttons on the DTMF (dual tone multi-frequency)
"Touch-Tone(TM)" pad are for the last four tones that make up the 16
place DTMF signalling set. You won't normally find them on typical
telephones nor in typical "telephone numbers", but they are legimate
DTMF signalling tones nonetheless. Among other things, they can be put
to good use for repeater/autopatch control, etc.

hi all
having done all the standard mods some time ago and now blissfully
confident that all is well with the radio it comes as a surprise to hear that
failure of the V/UHF output may not be due only to heat .
i would like to hear if anyone who has done the fan mod has in fact
blown the V/UHF final or is the prob still confined to those who have not.
my radio runs in my mobile all day and spends a lot of its time on
vhf
so as you can imagine im more than curious. The other option of course is
to flogg
the thing off now its out of warranty and buy a new one..
cheers john vk2khz

Blaine,
I was hoping that's what it was. I looked through the manual 3 time last night before I posted the question. If it's mentioned there I must have missed it.
One additional note that some may find interesting, I just picked a a Kenwood TS-2000X and at twice the cost of my FT-100 and FC-20 tuner the TS-2000 with it's built in autotuner won't come close to tuning the same hf bands that the FT-100 and FC-20 will. The FT-100 / FC-20 will tune 80 through 6 but the TS-2000 on the same antenna will only tune 40, 30, 15 and 6 meter.
Thanks for the answer,
73

You have to unsolder one end of each of the 2 RF chokes that bring the drain voltage into the output wideband coax transformers, but this isn't easy as they must be unsoldered from the backside of the PWB. Also you need to remove the gate voltage by removing the 2 gate chokes in a similar manor, smaller ones and I don't remember what the gate chokes look like off hand at this time. I don't have a schematic handy but you can't miss the drain chokes as they are about several turns of #16 wire and have white glue along the top to hold the turns together.

# 12880. Mobile radios comparison

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-12 19:44:09 UTC
From: Saad Mahaini
Topic: 12868  Message: 12880

Hello,

I've seen quite a bit of comparisons here between the 100D and 706 running mobile, but how about the Kwd TS-B2000. Anyone with experience running this radio mobile that will like to share with us please.

73s Saad N5FF

73 to you! I send to you this "free" invitation to become a member for my
mailing list "DX-NEWS"

If you choose to subscribe to this "free" mailing-list (for ham radio
operators) you will receive the latest DX-news via your e-mail address
everyday.
These mailings will include:
DX bulletins,
satellites,
vhf-uhf-
psk31
rtty
sstv
news from I.S.S
keplers
propagation,
29 mhz FM
50 MHZ
skeds
bulletins, activities IOTA,DFCF-DMF contest etc etc ..
.Also, it will be possible to organize skeds with stations from the mailing
list "FW,FR,VK,YV,PJ2,ZS,K,W,5V,VU,YB,HK,PY,LU,C6, etc... etc... I

hope to see your call on "DX-NEWS mailing list later ..."!

# 12882. Re: [FT100] New Owner and PSK31

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-13 01:26:19 UTC
From: Alex Turner
Topic: 12872  Message: 12882

Bob,thanks for responding. I did not have the correct jumper settings for the FT-100D. Had a heck of a time getting them for the FT-817 and frankly I thought the 100 would work with everything set for the 817,but maybe not. Is the correct jumper on the RigBlaster site I didn't see it Monday. It seems to be with the interface since the rig is ok otherwise.

Thanks

Alex,

Did you set the jumpers correctly inside the RigBlaster. My RigBlaster works great with my FT-100. Even use it from the mobile installation. No problems.

Good luck,

Bob K5WA

Subject: [FT100] New owner and PSK31

Just bought a FT-100D and am having problems getting the PSK mode to work. Using a RigBlaster Interface and the cable from my Ft-817,which looks as if it should be the same. However, the PTT does not seem to work and I never go into transmit. Receives great. Any ideas?
Thanks in advance.

# 12884. Re: ATAS Downunder

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-13 06:26:40 UTC
From: n9cv
Topic: 12852  Message: 12884

In message 12850 Eric (VK2KUR) said he ordered an ATAS-100 from ZL land at $US320. That is only about $20 higher than here. I convert that to be $AU615.00, so your estimate of $AU700.00 is not far off. I do not know if you have to pay an import tax on top of that when it enters the county from New Zealand. I have seen the ATAS-100 on special here for as low as $US269.00, but that has not been recently. Prices usually go down for Dayton Hamvention week in May.

I realize there are better screwdriver antennas on the market, but the ATAS-100 is a good, compact, easy to use all round HF antenna. Forget it for 80 meters, 2 meters, or 440 mhz. The size and easy / automatic tuning from the FT-100 control head was the primary reason I got the FT-100 instead of the ICOM 706. My ATAS-100 makes it through my 7 foot (2 meter) garage door with out removal from my Chevrolet S-10 Blazer (small SUV).

I have no complaints with this antenna. Working DX is not problem, I have worked (from my mobile) stations all over the world using the ATAS 100. It amazes me how often I can get in a pile up and compete with the bigger fixed stations. I am primarily on 20 or 17 meters, but have used it on all bands from 6 to 40 meters.

I do have a receive problem that only seems to affect Australia. I have received QSL cards from eight or nine Europian and Asiatic Russians, Bulgaria, Jordan, Isreal, Georgia, New Zealand, Japan, Antartica, and the list goes on and on. I haven't really checked, but I am close to DXCC (mobile) with this combination. All of these were worked mobile using the ATAS-100 / FT-100 since July 2001.

The Aussie receive problem I have is: the QSOs are fine both ways between here and Australia, but I never seem to be able to receive QSL cards. It may be that Aussies spend so much time trying to operate those locally manufactured screwdriver antennas, that they are totally exhausted when it comes time to put a return card in the mail. HI HI

I just had to throw in that dig because for some reason I never get cards from VK land. The last Aussie I talked to was during the Olympics. It turns out that your Olympic television broadcasts were delayed, so I gave him the results of several events before they were shown on TV. He also could have gotten the same information on the Internet if he wanted.

73. Enjoy your FT-100. I love mine.

If you go directly to step 4, then step 4 should be
called "preventative maintenance" instead of "repair". If you go
through the five steps sequentially from 1 to 5, then step 4 is
correctly named "repair". I would much rather do "P.M."
than "repair" any day.

Thanks Eric.

I stole the following info from a message by VE7BAQ appended here.
After going to the referenced web site, I realized that I counted the
mic connector pins backward.

IT IS REALLY PINS 4 and 6.

If Luiz (PY4BYE) comes back he will now have a direct reference on
the web to the picture of the microphone connector.

The following is VE7BAQ's append:

From: "ve7baq" <carls@c...>
Date: Tue Mar 12, 2002 12:55 pm
Subject: Mike Button Connections

Regarding the mike button resistor values listed in the previous
posts, there is a clear picture of the hookup and mike connector
designation (Grd, SW1, SW2) at www.mods.dk
Also a picture of the mike jack pinouts.
Just click on Yaesu and go to FT-100.
Einar VE7BAQ

Forget it,

Your money would be better spent on an aftermarket speaker like an amplified motorola or if you like DSP, get the clearspeech dsp. As far as filters go, get the 500hz cw if you like that mode and definitely get the am filter as it really makes the radio kick ass as a swl rx.
The TCXO is a waste of money as I found mine to be rock solid with or without it. The tone board is a definite add on as it makes finding tones on the output of repeaters easier fer sure.
I added all of those toys in mine while it was apart for the strap mod. If you care to add these items in yourself, its not too hard but a steady soldering hand is a must for the filters and you will have to dig into the radio to do it.(Take a look in the archives for my pix to see if you are man enuff) The best way to sum it up is:

"Pregnant women, persons with heart ailments and small children should not board this ride."

If its going in for the mods, then have them chuck the options in that you want, with the exception of the down time (6-8 weeks) they are fair on the install price.. Regards.. Richy N2ZD

Hi John,

IMHO I cant recall but the failure number is small (radios with the fan mod). The main problem is use, the more you use it there (uhf vhf) the greater the chance of damage or wear and tear leading to damage. If one were to wait too long to do the mod, the damage may be already done and the final on its last leg.
I would bet that most are taken out by failure of other components mentioned also. Regulators etc.. If they overheat as well, spikes occurring during their failure can cause damage. Most that report final failures say that the side of the radio gets hot while idling in RX. I never had that occur on mine so I suspect that some failures of the final are related to inadequate cooling of the final and other failures occur from surrounding/supporting component failures.

Hi Saad,

Getting ready to install one now with the rc2000 control head, I will report back with my opinions. Be advised they are hard to come by now as the new lower price and free rc2000 completely depleted stock at almost all retailers.. Kenwood reported back that the next batch is due out in the summer..

Be advised, its a big radio to go mobile with. Its size is the exact dimensions of the 430,440,450 radios. Hard to hide for sure!!

So far in bench testing it, the radio has a real nice RX and dsp is very good. The tuner is not like the older Kenwood tuners but the newer relay driven type (ugh) it works ok though. Most features are intuitive but a Kenwood sponsored TS-2000 five day course would be helpful as the radio does alot more than a dope like me can figure out.

If you have the room for its "non-mobile friendly" dimensions its a nice rig, but wait to see if Yaesu counteracts with a price drop of their own on the FT100D or 847. The FT100(d) is hard to compare though, if you have a good one like I did, the radio is hard to beat for its size and performance. I worked 1000's of contacts on my FT100. Its quirky but a joy to use and hard to beat when its set up properly. Size aside though, my TSB-2000 so far is sweeeet!!
Regards.. Richy N2ZD

# 12892. Re: [FT100] ATAS/HamSticks on 40M, was Re: Curiosity ?

Take out one of the bolts for the roof rack and drill out the threaded bolt
then feed your cable through that way. You can ground to the inside of the
roof. I sliced off some of the cable covering exposing the braid (about
1/4") , opened a ring terminal and crimped it loosely around the cable Then
I soldered it to the braid, connected the ring terminal to a ground on an
inside roof beam under the liner. No one will ever be the wiser to the
hole. But works great !
Only good on vehicles with roof racks though hihi!

Bill

# 12893. RE: [FT100] ATAS Downunder

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-13 12:57:16 UTC
From: Eric van de Weyer
Topic: 12852  Message: 12893

Hi Alek,

it was I who raised the issue of the ATAS-100 in Australia and, contrary to your suggestion, the price was not the reason that DSE does not import it. I actually spoke to Chris Ayres (who looks after all Amateur related things at DSE) at the Wyong field day and he told me that there was some problem with getting approval in this country for the antenna because it has a motor in it. I can't remember the exact things he said although I had heard something along this line before. Because the bean counters thought that they would have to get the antenna specially tested, they decided to just not import it.

I bought my FT-100D in early December and paid around A$2500.00 for it. At the same time the IC706MkIIG was around A$2900.00. I have not regretted my decision as it is a supurb radio.

I have also just ordered an ATAS-100 from the distributors in ZL as they have no problem stocking it and will happily sell it to me. It is costing me NZ$840 pluss P&P of about NZ$44. this will equate to about A$700. This is on par with the US price of around US$320.

From all I have heard/read about this antenna, it is a good unit and is designed to work with the FT100 rigs. Is is not the same as some of the other "screwdriver" style antennae available in this country as it has electronics in it to control it from the FT100. It also appears to be considerably slimmer than any other antenna of this type that I have seen.

I am awaiting keenly the arrival of my new toy. I may be the first to get one, I don't know but I am fairly sure I won't be disappointed when it does arrive.

73....Eric VK2KUR

Subject: [FT100] ATAS Downunder

In a recent posting, someone wondered why the Australian Distributor for Yaesu is not importing the ATAS-100 mobile antenna system.

I think it is because it would probably end up being priced around $850 - $900 AUS including mounting kit or around $700 AUS for the antenna alone. This would put it right out of contention as far as sales in this country are concerned. Those estimates are conservative. The $840 you pay for the FT-100 in the US equates to about $1615 AUS. The price in Australia for the

FT-100 is currently at $2000.00 AUS or $1040 US. A month or two ago, it was
closer to $2500 AUS

Nobody would pay that sort of money for a toy antenna in this country.

We have several antenna manufacturers in this country who produce far better antennas at far better prices. The distributor is no doubt aware of this fact and hence has chosen not to sell and support the ATAS-100.

To all those of you who are using the ATAS, sorry about the "toy antenna" dig. It's a thing we Aussies do. Hi hi. I'm sure it's a great antenna.

73, Alek.
VK6APK

ps, As a matter of interest, I think the Icom IC-706Mk2G is still well over
$3000.00 AUS here. That's why we buy Yaesu.

Hi Ken,

unfortunately we Aussies have a bad reputation for QSLing.

I personally QSL every new contact as I believe that it is a courteous thing to do as well as getting pleasure myself from receiving them but a lot of VKs just don't care and don't QSL at all. I'm affraid that it a shame that I have to live with.

You can be certain that if we ever have a contact on air, you WILL get a card from me.

Subject: [FT100] Re: ATAS Downunder

In message 12850 Eric (VK2KUR) said he ordered an ATAS-100 from ZL land at $US320. That is only about $20 higher than here. I convert that to be $AU615.00, so your estimate of $AU700.00 is not far off. I do not know if you have to pay an import tax on top of that when it enters the county from New Zealand. I have seen the ATAS-100 on special here for as low as $US269.00, but that has not been recently. Prices usually go down for Dayton Hamvention week in May.

I realize there are better screwdriver antennas on the market, but the ATAS-100 is a good, compact, easy to use all round HF antenna. Forget it for 80 meters, 2 meters, or 440 mhz. The size and easy / automatic tuning from the FT-100 control head was the primary reason I got the FT-100 instead of the ICOM 706. My ATAS-100 makes it through my 7 foot (2 meter) garage door with out removal from my Chevrolet S-10 Blazer (small SUV).

I have no complaints with this antenna. Working DX is not problem, I have worked (from my mobile) stations all over the world using the ATAS 100. It amazes me how often I can get in a pile up and compete with the bigger fixed stations. I am primarily on 20 or 17 meters, but have used it on all bands from 6 to 40 meters.

I do have a receive problem that only seems to affect Australia. I have received QSL cards from eight or nine Europian and Asiatic Russians, Bulgaria, Jordan, Isreal, Georgia, New Zealand, Japan, Antartica, and the list goes on and on. I haven't really checked, but I am close to DXCC (mobile) with this combination. All of these

were worked mobile using the ATAS-100 / FT-100 since July 2001.

The Aussie receive problem I have is: the QSOs are fine both ways between here and Australia, but I never seem to be able to receive QSL cards. It may be that Aussies spend so much time trying to operate those locally manufactured screwdriver antennas, that they are totally exhausted when it comes time to put a return card in the mail. HI HI

I just had to throw in that dig because for some reason I never get cards from VK land. The last Aussie I talked to was during the Olympics. It turns out that your Olympic television broadcasts were delayed, so I gave him the results of several events before they were shown on TV. He also could have gotten the same information on the Internet if he wanted.

73. Enjoy your FT-100. I love mine.

Ken - N9CV

Alex,

The jumper settings are on page 8 of the RigBlaster manual. I'd list mine for you, but I use the RJ model and it is probably different than the "standard" unit, which you probably have. I don't know if the website has any settings.

The logic of the jumpers is that it is trying to accomplish two things:
1. Tie the microphone input to the microphone output cable.
2. Jumper in the audio from/to your sound card.

So even if you have no schematic, settings or anything, you could use your VOM to trace out the connections from P1A(input) to P1B(output)for the proper pins. The RigBlaster circuit board is well marked.

Finally, for one of my other rigs that I switch to, I just use the VOX setting so I don't have to change the jumpers. That works quite well and you only have to get mic connections right without worrying about the PTT.

Good luck,
Bob K5WA

# 12899. Before and after AM filter observations and general notes.

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-13 15:33:29 UTC
From: recurve95
Topic: 12899  Message: 12899

Hi Group,

I ordered the 100d a few weeks ago and received (very rapidly by the way from HRO) it in fine shape. The serial number I got was 1Ixxxxxxxxxx...2001 production. I also ordered the AM filter at the time, but it had to come from another HRO store, so it was a week later comming in than the radio. That gave me time to put the rig in the shack for a shake down on the regular shack antenna...a full wave 80 meter loop at 40 ft. I opened up the rig and the SWR mod was done very well...not just the sticky copper tape, but a strap soldered to some RF shielding and screwed to the main rib at the center of the radio. While the radio was open, I did the fan mod. Very easy to do. I ended up using two 100 ohm resistors in parallel. I installed one side with a soldered on ring connector, and the other side went to one of the black ground wires for the fans. Buttoned everything back up and all was well. The fans run as described in the mod.

The performace of the radio on the ham bands is just short of amazing. RX is very good in comparison to my old trusty Icom 751. I hear stations as well or better on the 100d. DSP works very well, and the adjustable DSP filter settings do a good job. I did notice that the front end of the radio is broad on rx. The first tip off was in reception of WWV on 10.00 mhz. There were some shortwave stations along with the reception i expected to hear. Tuning to the fm broadcast band was a bit disappointing. I live very close to a local "megawatt" fm station and it was being received all through the fm band. No doubt that the high gain antenna I have for 2 meter use was not helping matters. I plan on doing some testing once I am out in the mobile to see if it improves. After a call to HRO about the fm broadcast rx "intermod", I learned that Icom and Yaesu only guarantee the their specifications to ham band only. I also learned that the 706 does about the same or worse in regard to fm broadcast rx.

When the AM filter arrived, I installed it in the radio. Its a job that requires a bit of work to take the radio apart...about 5 micro coax connectors and a few ribbon cables to remove, remove the screws and out the board comes. A digi camera or a diagram would make this job easier for those of you leery of doing the job yourself. Once the board is out, the filter drops right it and solders to the board. I would not recommend this filter installation to "first timers" for mods or soldering, you would be better off letting someone else do it that has done it before. While the board was out, I took the time to scrape off the green coating around the screw holes. There have been several postings on the group about the somewhat poor grounding connections at these screws, and now is the

time to do it once the board is out. WIth the paint off, the copper ground plane was exposed and I tinned this with my soldering iron. Everything went back together FB. The radio worked fine after the install of the filter. The interference on 10 mhz WWV was gone after the filter install. Selecting the am filter to OFF, on the menu confirmed that the interference was still there, but when the 6kc filter is inline, it removed it. Very worthwhile filter to have. It does help out also on AM broadcast rx.

The last mod I did was the "mike mod" Its easy to do, and can be found in the file section of this group. THe audio reports I got were good before the mike mod, but after the mod, they were excellent.

Now, I am in the process of installing the 100d in my truck...a silverado pickup. The install will take some time as I can only do this as my "day job" allows. But I can tell you that I really miss running the 100d in the shack. After about 2 weeks of "base" use, I think its a much better performer than my old 751 is on RX. The icom 751 was no slouch on RX by the way. It just underscores the improvements made using todays technology vs. 1980s technology. SSB TX on the 100d gives excellent audio reports with the default settings. All contacts I made prefer the TX audio on the 100d to the 751. The AM TX audio on the 100d is much improved by changing the default settings for the AM CARRIER level in the hidden F menu. Those settings can be found elsewhere on the net, but I can provide the settings I use for those interested. I probably made 40 to 50 contacts with it in 2 weeks with excellent results. I am very pleased with the performace of the radio "out of the box". With the addition of the AM filter, some very basic mods that were easy to do, and common sense operation, I am still very pleased with the 100d and would recommend this radio to anyone considering it for mobile. THe plan is to finish the radio install in the truck and run it into a screwdriver style antenna made by Tarheel antennas. I'll have the antenna ready to install soon.

Thank you to those of you that took time with me on the air to do comparisons to the icom and to compare the DSP mike settings on the 100d. The last comment ill make in this post is that
the "compressor" or speech processor is just like any other speech processor that I have heard on the air. It works fine for DX when you need somewhat "punchy" audio, but sounds best off for normal ragchewing.

Another idle musing...

The other thing that I noticed with the icons... at one point
someone said that the tuning icon showed the direction that the ATAS
was moving, and we all poo-poo'd 'em.

Well, he was right. if you watch very closely as the ATAS tunes, the
animated icon _does_ show direction. It is not very clear because the
animations are only three frames each...

On the gate side close to the device there are resistors from each gate lead to ground that are still in the circuit when the gate chokes are removed, I don't remember the value but they are on the back side of the PWB.

The main reason for the notice is to remind certain publishers that internet posts are the property of the original poster, not to be used for publishing books and magazines. It cost me last year to buy a book (conference proceedings) to find I was an author, even though I hadn't made a submission. Had I made a submission, I would have received the book for free.

While the term 73 IS prior art, all individual words I use are also prior art. What is covered by the copyright is the particular selection and order of the word groups.

# 12908. MD-100 Low Audio

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-13 22:30:33 UTC
From: mike_ketchum2000
Topic: 12908  Message: 12908

I just purchased a CT-69 adapter and MD-100a8x desk mic. I hooked them up right out of the box to my FT-100 and now have very low transmit audio when using the MD-100. When I say low I mean I have to practically swallow the mic to get any descent output. If I switch back the stock mic the audio is right back where it should be with no problems. I turned the mic gain of the radio up to 100 and still same results. Is there anything that needs to be done to the MD-100 for it to work properly or am I missing something?

Thanks,

Mike

# 12909. FT-100 Prices etc

Yahoo group: FT100 (2002-01 — 2002-06)

I have been reading a few posts re. cost of FT-100 rigs and mobile antennas etc. in the USA and VK and ZL Land.
Just thought I would quote a few prices from a Canadian Dealer.
FT-100D $1549.00 Canadian, Shipping Included in Canada.
IC-706MKII/G $1599 Canadian, Shipping Included in Canada.
ATAS-100 $455.00
ATT3K-100 Antenna Base Mount ☐ $155.00
All prices Canadian Dollars: prices quoted right out of their March Price List.
Einar VE7BAQ FT-100D

Wonderful, wonderful, wonderful!

Thanks Dave, your sentiments are echoed by all of us who have the pleasure
to own and use the FT-100 miracle.

73, Alek.

Yes - you will need an impedance step-down pre-amp in order to make it work. Go to http://hometown.aol.com/ampmicro and you'll see what I mean. Until you do that the audio will be weak and very muffled due to the effective low-pass roll-off of you mic input to the rig. Too bad Yaesu doesn't make it clear that the MD-100 mic is not compatible with the FT-100(D). Nor is a slew of other mics with nominally high output Z. The rig has a low Z input. The pre-amp will take care of the impedance transformation. You really don't need any power gain. You just can't have the rig loading down the mic output. Good luck.

I found that capacitor box from MFJ (MFJ-910) is the best thing to use with the ham sticks. I first bought one 10 years ago and had to replace it this past few months. I started using it with a FT-890AT mobile and now with my FT-100D. The FT-100D did not like the hamstick on 40 without the capacitor.

I've had my "D" for about 15 months and still absolutely love the
receiver. Take a look at my message # 10277 regarding AM operation
if you like AM op. Also, I recall reading somewhere that below
about 2 MHz you need to turn on the "IPO" feature (which bypasses the
low noise front end) to eliminate front end overload. Then you'll
find you have a decent receiver even for commercial AM reception.
I think you might try hitting the IPO feature on the bands where you
have an extremely strong local station getting in your front end.
Enjoy the rig. It's excellent. My only remaining 'complaint' at
this point is the fan noise but I can always throw on the headphones!

From: Alex Turner
Topic: 12915  Message: 12915

Ok,has anyone used the DATA port on the rear of the Ft-100D for PSK31. I am not able to get it to work on the 100D that I have.
I have heard from several of you who are using the Mic input, but I would like to use the Data port since I have a cable already. I am using the RigBlaster Nomic which works great with the FT-817 through it's Data port. The pins are the same, but there seems to be some differences or the Data port on this unit doesn't work.

Thanks

Works fine here. I use the data port...

Infact. there is a information thingy that shows the psk31 interface I use with my 100 in the files section.

I use the Rascal interface from Buscom. It plugs right into the six pin data plug on the back of the FT-100. Comes complete with cables, nothing extra to buy. Plug the com port cable (supplied) into the computer and the six pin plug cable (supplied) into the back of the Ft-100. Works great and they supplied a complete schematic etc. with it. Simply reduce the power output of the rig and go. You may have to adjust the trim pot in the Rascal box to set the level to the proper drive but that's all.

Thanks,Jesse. I'll take a look at it. I assume there are no settings to change in the rig itself. I think the problem is in the RigBlaster,so I'll drag out the scope and see what I can find.
Thanks again.

I hope the above prices are list and not sale (over the counter) prices. If these are sale prices, I would suggest a road trip (south of the border) on your next radio purchase. Even at the current exchange rate of .62 you would still save several hundred dollars plus the federal and provincial VAT taxes. On my last trip north, I bought a complete set of new Michelin tires because they were considerably cheaper at the Canadian Tire Stores. It looks like radios are cheaper going south. So much for NAFTA. I still haven't figured out who benefitted from NAFTA. It sure does not look like it was the consumer.

I hope the above prices are list and not sale (over the counter) prices. If these are sale prices, I would suggest a road trip (south of the border) on your next radio purchase. Even at the current exchange rate of .62 you would still save several hundred dollars plus the federal and provincial VAT taxes. On my last trip north, I bought a complete set of new Michelin tires because they were considerably cheaper at the Canadian Tire Stores. It looks like radios are cheaper going south. So much for NAFTA. I still haven't figured out who benefitted from NAFTA. It sure does not look like it was the consumer.

# 12921. Re: New Owner and PSK31

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-14 15:50:17 UTC
From: kg4qqx
Topic: 12872  Message: 12921

I have a similar set up. I've owned an 817 and been using it on PSK31 as well as other digital modes via the Rigblaster, bought an FT-100d a in February and wanted to use the Rigblaster on it. For the sake of expedience I opted to buy the $12 cable from Rigblaster which consisted of an RJ-45 to RJ-11 connector and a new jumper with an inline resistor, as well as a new Jumper diagram (which couldn't be any more different from the jumper settings on the 817.

I would be happy to email out a scanned image of that diagram if anyone is in need....

In any event I found the fact that I had to change jumper settings each time that I swapped radios to be unacceptable. As a result I decided on a new approach.

Firstly I have and use a CT-62 cable for both rigs for CAT control (MixW makes excellent use of this feature on both radios...). I noticed that most interfaces only use a couple of pins on the com port for PTT control (either DTR or RTS and ground) and that coincidentally the CT-62 cable doesn't make any use of the DTR or the RTS pins (it simply ties them together with no useful purpose).

So I purchased a Rascal interface from BuxCom which requires no power supply (less stuff to pack along when away from home) and is much lighter it also has the advantage of making full use of the DATA port on each radio so that a microphone connection isn't needed.

This leaves me with a VERY portable interface which plugs directly into the back of each radio in the same fashion as well as making use of the only existing comm port on my computer for both CAT control and PTT via the interface.

I use the Rascal interface from Buscom. It plugs right into the six pin data plug on the back of the FT-100. Comes complete with cables, nothing extra to buy. Plug the com port cable (supplied) into the computer and the six pin plug cable (supplied) into the back of the Ft-100. Works great and they supplied a complete schematic etc. with it. Simply reduce the power output of the rig and go. You may have to adjust the trim pot in the Rascal box to set the level to the proper drive but that's all.

# 12923. Re: New Owner and PSK31

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-13 21:41:42 UTC
From: kg4qqx
Topic: 12872  Message: 12923

I also recently purchased an FT-100d and wanted to use my rigblaster (also working splendidly on an FT-817)I ended up buying a 12.95 cable from rigblaster which was a modular to smaller modular cable and an additional jumper which had a resistor inline, as well as a diagram of the new jumper layout. I would be happy to scan and email you the diagram if you need it, perhaps you can add your own resistor.

I have recently decided on another option which works with both the 817 and the 100d via the data ports on the back and a BuxComm Rascal. The rascal doesn't need any power supply so it becomes more portable, and the comm port only uses two pins (coincidentally the same two pins that the CT-62 CAT cable doesn't use) and can be integrated into the CT-62 CAT cable so only one port is needed for both CAT and PTT via the Rascal interface. Switch rigs by swapping the Data and Acc plugs. MixW can now change frequency and mode on the radio for me depending on which mode I wish to use, not to mention changing frequency based on my clicking on the DX cluster item of my choice. MixW the never worked so well, or so easily!

The data port works fin on both my 817 and my 100d without any
modification to the cable. I did need to change some settings on the
100d to get it to work properly.
Specifically I changed:

Menu 34 to PCt-U
Menu 38 to 0
Menu 39 to 1170

and of course it needs to be in DIG mode to transmit...

Best Regards,
Patrick E. Donohue (KG4QQX)

Oops Finger trouble again! Misspelled the web site. It is www.buxcommco.com

go to the psk31 page and select the Yaesu interface page.

The one I use is found at

Order No. R-FTMDIN

YAESU FT-817, (FT-90, FT-100, FT-847* ..) and YAESU transceivers having a, 6 pin Mini DIN for data interfacing. This interface utilizes transformer coupling between the PC Sound Card line in/line out, and your transceiver. Automatic PTT is via serial comport and software control. (*Important NOTE: The FT-847* uses this interface for VHF operation only. If you wish to use the FT-847 at HF, see RASCAL model R-3).

Hope this helps

I have the same problem. When I contacted Yaesu about it, they suggested a couple of things.

1. Modify the mic to have an external 5 volt supply for the filters, the FT100 doesn't supply power to the MD-100.

2. Change the impedance of the MD-100 to be closer to the impedance of the stock mic.

I haven't tried either one of the mods, but plan to in the near future.

Just what I had been told,

Jerry K8CMI

It's one of the "F" sub menu commands. But you don't want to change
it unless you have a calibrated signal generator.

Date: 2002-03-15 17:11:36 UTC
From: backhoefade
Topic: 12908  Message: 12930

The input impedance of the FT-100 is very low which makes it incompatible with most microphones. You need to provide an impedance transformation. I previously explained how to do that and gave the website where you can buy a pre-amp designed specifically for the FT-100D. There's even an article from QST about adapting nominal impedance mics to the FT-100(D) at the website. By the way, the FT-100D does provide 5 Volts to its stock mic so if that was the only issue you could work around that.

Bottom line - It should be very clearly stated in the customer literature which accessories are compatible with which rigs.

Here's the info for the impedance transforming pre-amp. You can use
a D-104 mic with the FT-100D and sound terrific.

Go to http://hometown.aol.com/ampmicro and you'll see
what I mean. Until you do that the audio will be weak and very
muffled due to the effective low-pass roll-off of you mic input to
the rig. Too bad Yaesu doesn't make it clear that the MD-100 mic is
not compatible with the FT-100(D). Nor is a slew of other mics with
nominally high output Z. The rig has a low Z input. The pre-amp
will take care of the impedance transformation. You really don't
need any power gain. You just can't have the rig loading down the
mic output. Good luck.

Subject: [FT100] Re: MD-100 Low Audio

The input impedance of the FT-100 is very low which makes it incompatible with most microphones. You need to provide an impedance transformation. I previously explained how to do that and gave the website where you can buy a pre-amp designed specifically for the FT-100D. There's even an article from QST about adapting nominal impedance mics to the FT-100(D) at the website. By the way, the FT-100D does provide 5 Volts to its stock mic so if that was the only issue you could work around that.

Bottom line - It should be very clearly stated in the customer literature which accessories are compatible with which rigs.

Mark,

Mine left for Cerritos yesterday. I asked for all mods and they told
me they do a complete alignemnt. BTW-
FT-100D SN# 9J01518 Purchased 10/08/01

I packed mine up in the factory box, and placed it in a USPS Priority
mailer. Mailing it with $900 insurance costs $21.95

I hope the advertisements and product data sheet lists the applicable radios. What's really a shame is you can't really trust what HRO, Yaesu or anybody just verbally tells you anymore. I'm not saying they're "liars" that can't be trusted. But what I am saying is that more often than not, if the person you're talking to isn't quite certain, they may say to go ahead a buy it, especially if there's financial incentive in doing so. After all, the customer can just return it, right?! Right, but what a nuisance. Try to find something in writing. Often there's a list of "applicable radios" listed in the customer documentation for accessories. So I would look there. For the MD-100 mic I would start by trying the HRO on-line product catalog and maybe go to the Yaesu website and try to find some written info. I'll bet you 5 new DX entities that you will need that impedance transforming pre-amp to make it right. And when you get the pre-amp in there it'll sound great.

You will really like the rig once the mods are done. I had mine done about a year ago and it performs on all bands flawlessly. Do the microphone mod and you will eliminate the muffled audio sound and get terrific transmit audio reports.

How to use key pad on sp/mic? Looks like is Lock and every time I
press any number the small red LED blinks. I can't change the freq.
Help please

# 12938. Cost of Repair/Upgrade

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-16 02:04:30 UTC
From: gp_man314
Topic: 12938  Message: 12938

Greetings FT-100 users,

I purchased an FT-100 in October of 1999. I have not used it much `till recently I installed it in my car. So far I get about 70 watts out on 80 and 40 meters. Seems to work OK. However, from viewing this yahoo group and from reading other user groups I believe hard times are in store for me and my FT-100. I'm referring to the grounding/high SWR problem. I understand there is some kind of adhesive copper grounding strap that comes loose inside the radio.

I'd really like to know what it costs to have Yeasu repair this defect. Could anyone tell me what Yeasu charges to fix this problem? Is there an upgrade option to basically change the FT-100 into an FT-100D as far as that is possible? What does that cost?

Any information would be very much appreciated. If this information has already been discussed, just give me the message numbers and I'll take it from there. I've search and paged through a year and a half worth of messages but so far, I have not stumbled across this information.

Thanks,

Will, N7KS

Hi Paul,

I have not read all the responses, but just found that www.westmountain.com (the rigblaster people) now have powerpole connectors and accessories in small quantities, and reasonable shipping charges (at least to Canada which is what I am comparing). For UK, their web says www.wsplc.com (but that is probably for only the rigblaster products, since that is all the dealer in Canada is handling). Ordered some last night plus the power distribution panel, so we will know shortly.

Thanks to all that replied, getting hold of these Powerpoles is not that easy in the UK, the distributer won't e them and the retailers only carry the SB50's which I don't think are suitable. RS Components who retail these,
will sell me 10 of each colour but will charge me huge amounts to send them
to me!!. They will sell me them over the counter if I am trade, which I am not.
I won't give up though!!!!!!

I contacted Powerwerx ( www.powerwerx.com ) about international shipping and they are happy to do so. I have been trying to contact the New Zealand agents here in ZL as well, but they don't answer their phone or return phone calls when a message is left. Strange way to do business. I am considering replacing all of my dc connections for all my gear with the 30 amp model as well.
They list 10 sets for $US9.95. 50 sets for $US39.95 for example, so seems a reasonable price to me.

Grant, ZL2BK.

# 12944. FT-100 Duty Cycle Rating...

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-15 17:54:53 UTC
From: kg4qqx
Topic: 12944  Message: 12944

Can anyone tell me whether or not the ft-100d is rated for 100% duty cycle? I've found several references stating that digital modes should be run at 50% of output power unless the radio being used is rated for 100% duty cycle.

Hi, I'm Marco IK0LLK. I'm sorry for my inglish that is bad!
I have a problem with my Yaesu FT100.
Last year i changed the main unit becouse when i start my car the extracourrent demaget it.
Now i have a other problem.
When i go in UHF 432MHZ FM my receicer present (have) many noise
I think that is a problem to PLL.
Have someone the same problem?
Many Thank's again.

# 12946. Hi SWR Icon on 440

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-17 21:36:46 UTC
From: barry_zoll
Topic: 12946  Message: 12946

I purchased my rig last year and never used it on 70 CM. I purchased an MFJ dual band mag mount and had a 10 minute QSO on a 440 repeater. All of a sudden, the SWR icon appeared and power out dropped. Tried another antenna that I use in the same truck (Cushcraft dual band) with my FT8100 and had the same situation. My FT7100 and 8100 work fine with both.

Any suggestions? 73 de N1toq

# 12947. Function Settings

Hi,

I had the same problem... I sent the radio back, indicating that it had troubles on this band and tehy fixed it (still under warranty) as far as I can see, they added more grounding material to several areas. you could also call Yaesu and ask for tech support and they may be able to help you out over the phone.

make sure that your radio is grounded (from mounting bracket to vehicle ground) with braided cable. also make sure that your antenna checks out. the tech at Yaesu told me that the final amp is so expensive a part, that they do everything in their power to protect it. hence Hi SWR when it may not be warranted at times.

Good Luck

# 12950. ATAS menu

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-18 06:16:27 UTC
From: acbross
Topic: 12950  Message: 12950

OK Guys, I've had my FT100 for a couple years now and run it mostly in our camper with separate HF and UHF/VHF antennas when we go on vacation . This winter I decided to remove it from the camper and keep it in the house so I could build a PSK adapter. This evening I was experimenting with the ATAS100 menu #61 with the ATAS100 and a wattmeter connected. I was under the impression that switching from ATAS-1 to ATAS-2 on that menu switched the FT100 output from a single output port to dual ports. WRONG!!! No matter where I set it the HF/6m always comes out the HF lead and the UHF/vhf always comes out the other. Going back and looking at the diagram on page 14 they confirm this by using both output leads whether using the ATAS100 as a single antenna (with a duplexer) or using separate antennas. SO my question is what the heck good does switching between ATAS-1 and ATAS-2 do??? I see no difference in operation at either setting.

After reading the explanation of MENU #61 on page 94 it says ATAS-2 activates the ATAS100 on both antenna ports. So what difference does that make? Could some one verify that their FT100 works the same? Can anyone tell me why this setting is even there?

I believe that ATAS-1 allows the TUNe button to run the antenna up
and down and check SWR on both antenna connectors (HF-6m and U/VHF).
In ATAS 2 the TUNe button and SWR checking only works on the HF/6
meter connector. You will also see that there are two other options
listed for menu 61. They both have to do with TUNe button operation.
One is off and the other is for use with the FC-20 antenna tuner.

Barry,

That is exactly how my FT-100 failed. I hadn't used it much on UHF. Making contact with some friends heading to a hamfest on UHF simplex my rig started displaying a HI SWR Icon. I was at 50% power. On the bench I found the VHF/UHF final was oscillating between 200-300 Mhz. At that frequency I am sure that my Larsen Dual Bander did have high SWR. Anyway, the final MOSFET shorted. Yaesu wanted $505 to repair it. (mine was two weeks out of warranty!) Passed on that offer, and decided to repair it myself. Found that the SRF7043 MOSFET is exclusive to Yaesu and you can't buy them on the open market. Yaesu wants about $230 for the part. I think I have found a suitable replacement part. Samples have just arrived and I have to install and test. It hasn't been fun!

I don't know if the "Hi SWR" mod affects V/UHF or not, but it is probably worth installing if you haven't already.

Yes, do the fan mod! What is happening is the final is overheating and causing the swr to rise. Add a 29 to 50 ohm 1 watt resistor from ground to one of the fans black wires. This will force the fans to idle moving air thru the rig and subsequently cool the final. This will prevent the swr icon from triggering. If the fan noise doesnt bother you go with a value which will allow for more air movement. Lower is better in my book.. Regards.. Richy

PS Yaesu will tell you otherwise, several "canned answers" would be:
1. Gee that a new one on me...
2. Must be your antenna
3. Hmmm
4. Its your coax
5. Your the first one with that problem...
6. check your grounds...

They hit a button on the phone console and any one of the above will be generated (its random)and forwarded over the phone for your listening pleasure.

Regards.. Richy N2ZD

Hi Will,

Your best bet is to call them and see if they will honor the mods to the rig. When you send it in, specify in writing that you want the fan mod and swr mod performed to the rig. They have usually performed such mods for out of warranty radios and tacked on a realignment charge of just under 100 bucks, but its best to call them and see what kinda "scheme of the month" they will attempt to have you send in a radio that should have had these mods when you bought it. If they offer to mod it for free, expect a long 8-10 week delay. If you pay good money to have it done, expect a short 8-10 week delay. :-P

> setting.

The ATAS-1 setting is there so you can retract the antenna when you're using the ATAS for V/U transmit. The DC voltage to control the antenna still comes across the HF port. The antenna is supposed to be fully retracted to use it on V/U transmit since the lower tube is sized to be resonant on those bands. While tuning the ATAS for V/U, unlike the TUN feature during HF, there is no feedback where the SWR is monitored for a minimum. It just fully retracts by supplying a DC voltage over the HF port for long enough to make sure it's retracted.

Others have reported that the SWR meter doesn't have a problem even if the ATAS is not fully retracted on V/U transmit, but I'm not sure if it is a good idea to operate it that way.

With the cost of a duplex to use the ATAS on V/U, you could purchase a second V/U antenna and mount it up higher and get some gain out of it, which is what most owners have opted to do.

Tell me how it suggests you set up for AM transmit.

I already know. This will just show us what the cheat sheet is worth.

I don't care if it's the perfect size and gold plated; if the information is lacking or inaccurate, especially for the info that's missing from the user's manual, then it's essentially worthless.

Please publish your success story (hopefully!) regarding the
replacement devices you are trying. That will be a great help
(unfortunately) for some of us in the future.

By the way, I believe there is a spurious oscillation issue in the
VHF/UHF amp too, which is eliminated with the same ground strap fix
as applied for HF.

Basically, to reiterate an answer already posted,

ATAS-1 and ATAS-2 merely tell the radio that you ARE using the ATAS but have either ONE or TWO antennas, the implication is that the TWO antennas is a separate unit for V/U

And PS that the radio should not concern itself with retracting the antenna if above 6M... basically, all this menu option does is tell the radio to ignore the "TUN" button if pressed above 54MHz.

BTW the radio will not transmit below 7MHz if either ATAS-1 or ATAS-2 is selected.

Yeah, found out about the "won't go below 40 meters" thing when I tried to use 80m once for a sched while the radio was set for ATAS.

It seems no matter what "ATAS" position I leave the menu in, it still tries to retract the antenna when I get out of the menu. I'll have to experiment with it some more. Not that it matters because I always use a separate antenna for VHF/UHF.

When my ft-100 got the 440 hi swr problem, here's what the service people wrote on the report.

"Verified faulty uhf transmit. Performed Yaesu modification to vhf/uhf duplexer circuit. Adjusted inductors L13, L02 and L37 in the circuit. Tested transmit and receive operation."

Take care. If you change the o/p transistor, you will still have the problem in the duplexer section. It will probably blow the new tranny as well.

It all depends what you mean by 100% duty cycle. The rating usually means X number of minutes transmit and Y number of minutes receive. Based on a standard, 100% duty cycle would mean 10mins of continuous transmit at full power. A resting period of so many minutes would be required before transmission resumes. 50% would be 5mins of continuous transmit at full power. 10 mins is a long time to be transmitting contiuously.

The duty cycle is the time percentage which the transmitter can run at full power output, as defined over a duration whereby the heatsink / fan system has achieved thermal stability. That means that the duty cycle spec (for example 50%) is the duty cycle you can continuously operate the rig at for a very extended period without it thermally running to very high temps.

I believe the FT-100D is rated at 100 Watts PEP, based on a 50 % duty cycle. So you can operate normal CW all day long with it set for 100 Watts output. By "normal" I mean NOT "dead keying" for lots of 15 second intervals while you play antenna, etc. That's not 50% duty cycle. You can also operate all day long in SSB at 100 W PEP.

AM operation is a bit trickier because you have the same PEP as SSB but you have an on-going 25 Watts rms carrier present so that raises the overall effective duty cycle a bit. But I would still say the rig can run AM all day long if you limit the output to 100 Watts PEP.

With FM the whole story changes. Here your average power is the same as your peak power so you must drop the output to 50 Watts on the HF bands; 29.6 MHz FM for example.

For 2 meters and 440 FM, I have to assume that since Yaesu advertises "50 Watts" and "20 Watts" output that they mean FM with no time limit. Personally I run mine at half power usually on 2 meters and 440. You give the PA a bit of a break thermally and you only give up half an S unit.

# 12969. Using Motorola microphone with FT100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-19 00:46:19 UTC
From: kraftwerk1976
Topic: 12969  Message: 12969

Hi. I bought some 8 pin (din) Motorola mics. on ebay a while back for very little money, and was wondering if anybody has tried to use Motorola microphones with the FT100? The mic. (6 pin din) that originally came with my FT100 is good, but I would like something a bit more durable. Has anyone tried to do this? Thanks.

# 12970. How do I split monitor ?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-18 23:21:24 UTC
From: kd6ccp
Topic: 12970  Message: 12970

Okay, am lost, how can I monitor the 440 band while searching the HF bands at the same time? I want to stay tuned to my local repeater group on 440, but at the same time chat and chew on the HF bands.
Thanks

# 12971. Re: Using Motorola microphone with FT100

I've tried two alternate mics and that's when I realized that the FT-100(D) is a unusual creature with a low input Z so when you try to use mics with more nominal output Z's, two things happen: first, the impedance step-down drastically reduces the drive level that the mic can offer; second, the hi-Z output of the typical alternate mic when worked against the input capacitance of the rig tends to roll off the audio response, yielding a rather bassy, muffled transmit audio. There's some good info about this at http://hometown.aol.com/ampmicro

I bought one of the pre-amps ($7.50 or so, if you supply the caps and resistors - it comes with the op-amp) so I can use my D104 with my FT-100D but ever since I discovered the mic mod and the outstanding transmit audio you get with the Yaesu mobile mic I've lost interest in the project.

The second antenna (vhf/uhf) is the way to go. the atas has no gain and is really weak on uhf/vhf. I also threw in a coax switch and mounted a 2 meter holoop ssb antenna on the roof ,it really gets the distance on ssb, sometime hundreds of miles while I'm moble. SSB works so much better than fm (if your into simplex) try it you'll like it! 73 Bill WB2IWC

# 12974. Re: [FT100] FT-100 Duty Cycle Rating...

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-19 01:59:34 UTC
From: Grant Mitchell
Topic: 12944  Message: 12974

Duty Cycle is rated in percent. It is the percentage of TIME ON compared to the total TIME ON / TIME OFF period. I will give you some examples.

TIME ON = 5 mins, TIME OFF = 5 mins, DUTY CYCLE = 50% (total time = 10 min)
TIME ON = 1 min, TIME OFF = 1 min, DUTY CYCLE = 50% (total time = 2 min)

As you can see in the above examples, both are 50% DUTY CYCLE.

TIME ON = 2 mins, TIME OFF = 3 mins, DUTY CYCLE = 40% (total time = 5 mins)
TIME ON = 3 mins, TIME OFF = 2 mins, DUTY CYCLE = 60% (total time = 5 mins)

In the examples above, it is not the amount of power used, but, the TIME ON that is used to represent DUTY CYCLE. 100% DUTY CYCLE would mean you are transmitting all-the-time with no break in transmission. I would not recommend you use the FT-100D at 100w at the 100% duty cycle in ANY mode. The recommendation of 50% of output power (50w) would be probably be best used in DIGITAL modes (HF)....however, I would still recommend a DUTY CYCLE of LESS than 100%. On page 59 of the FT-100D Operating Manual it states "The FT-100D is designed for a 50% duty cycle" for RTTY transmissions. Some others on the reflector have made suggestions on power settings for different bands / modes. I hope this is helpful to you.

Woah! The correct terminology is 8pin: RJ-45 modular on the Motorolas, 6pin:
RJ-12 modular on the FT-100... often confused with the physically similar
but 4-pin RJ-11

The Motorola would have to be severely rewired also... is it

Topic: 12944  Message: 12979

The key point I made in my post was that the time duration that the unit can be "on" continuously is limited by the ability of the heatsink / fan system to exhaust the heat. In other words, you cannot expect a transmitter which is rated for 50% duty cycle to be able to be "on" for 3 hours and then "off" for three hours and survive. That's ridiculous. The 50% duty cycle rating (or whatever the percentage happens to be) is practically limited by whatever maximum continuous "on" time the unit can handle without exceeding its maximum temperature spec. If the absolute value of the duration of "on" time in the definition of duty cycle was unlimited then "duty cycle" would have no practical meaning for equipment which has less than a 100% duty cycle rating. The "on" time would be completely arbitrary, say 4 days "on" followed by 4 days "off". Sure, it operated at "50% duty cycle" over those 8 days; but after about 32 minutes the finals burned up due to massive over temperature. Duty cycle, when applied to equipment which generates heat is all about power. The average power developed during the subject period must not exceed X % of the peak power rating of the device.

Average Power = 1/T times the integral P(t)dt, integrated over the time period of measurement, where P(t) is any function of power versus time and T is the period of the measurement. The value of the integration is the total energy developed during the measurement. When the total energy is divided by the time measurement interval, T, you have the average power developed during that interval. If the device rating is 50% duty cycle, then Average Power should not exceed 50% of the max power rating of the rig, which for the FT-100D would be 50 Watts. I base the 50 Watts on the fact that the key down CW average output power specification is 100 Watts.

Yaesu likes his request ----- more radios in the car!

I haven't tried the dual watch yet. I almost think you could achieve what he's looking for if it can be set to VERY quickly go and take a look at 440 MHz. I'll try it tonight. Probably it's more practical to have the extra little rig sitting there on your favorite repeater. Kinda comforting when your driving in a raging storm.

Well, I think the dwell time is set to 6 seconds. It would, at least, put a hole in the HF activities, and would also prioritize away from HF. The moment the repeater IDs he is forced to give up HF and wait for the UHF activity to cease. I never use the faeture for that reason. Although there are probably good scenarios to use it in.

Second post in a few days requesting a feature that does not exist. Try
a
FT-90 tucked under the FT-100!

Try an FT-8100R if you want a cool radio that is a true "dualie". Sold
mine to help finance the
FT-100... miss it sometimes, it was a neat radio. But, ya just don't
get the same charge playing full duplex on
VHF/UHF as trying to hammer thru a massive pileup on 12 meters from the
mobile, to work an OX station...
(twice within the last few days... two different OX stations, at that!)
There ain't nothing like HF !

Subject: Re: [FT100] FT-100 Duty Cycle Rating...

It all depends what you mean by 100% duty cycle. The
rating usually means X number of minutes transmit and
Y number of minutes receive. Based on a standard,
100% duty cycle would mean 10mins of continuous
transmit at full power. A resting period of so many
minutes would be required before transmission resumes.
50% would be 5mins of continuous transmit at full
power. 10 mins is a long time to be transmitting
contiuously.

Although this could be the problem on some the real fault lies in heat dissipation. If you need proof that the Fan mod is necessary,with an unmodded rig, simply key your mic on high power (UHF or VHF) and note that on a good antenna you will start with a low swr, watch in amazement as the one bar turns into two and then some as the radio begins to roast the 200 plus dollar final. If you do the fan mod you will delay or deter the generated heat from causing the swr rise.

# 12987. Re: [FT100] DC Cable now ATAS 100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-19 09:14:22 UTC
From: The Simpsons
Topic: 12983  Message: 12987

I would go for the SG239 as it will allow operation on all HF bands, including 160m. I suspect the matching range will be limited on 160, but at least you are not limited to 40m and above as you are with the ATAS. When parked up for the night etc. run a long wire from the antenna mount (to a convenient tree, perhaps) and let the SG239 match that. Much improved performance.
I use a SG239 in my mobile and it gives me usable performance on 80m through to 10m using a 1.8metre long wound fibreglass whip naturally resonant on 20m. Efficiency is poor on 80, but it does work. It won't match on 160 though. It even matches on 6m although the SG239 is not rated to that frequency. It certainly works there as I can hear beacons that are not audible without the tuner.
I run low mic gain on the FT100 and have found that the DTMF mic produces about 10 watts on SSB when the DTMF tones are being generated. This is more than enough to allow the tuner to tune without damaging the FT100 finals.
No contest as far as I'm concerned!!

Grant, ZL2BK.

From: Eric van de Weyer
Topic: 12571  Message: 12988

Hi Grant,

I have been buying the Powerpoles from Powerwerk for a couple of years now. I have personally bought two lots of 100 x 30A units and 2 lots of 10 x 75A ones. We haev also bought the same for sale through our local radio club.

I am now well into my second hundred 30A units and still have a way to go before I have everything changed over.

They are a great connector.

I would suggest that you purchase them in these sorts of quantities as it makes the postage and handling less in relative terms. From memory postage is US$25.00.

They have always been prompt even when I put in my second order about 2 or 3 days after Sept 11th they still arrived in about 11 days.

I contacted Powerwerx ( www.powerwerx.com ) about international shipping and
they are happy to do so. I have been trying to contact the New Zealand agents here in ZL as well, but they don't answer their phone or return phone
calls when a message is left. Strange way to do business. I am considering replacing all of my dc connections for all my gear with the 30 amp model as
well.
They list 10 sets for $US9.95. 50 sets for $US39.95 for example, so seems a
reasonable price to me.

I think I will go direct to Powerwerx as well. It makes life a bit easier to deal with the local agent if possible, and the price is often competitive as well. I am looking at quantities of 100 as well.

Thanks for the information.

Grant, ZL2BK.

# 12990. Re: MD-100 Low Audio

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-19 11:20:11 UTC
From: gdsteele
Topic: 12908  Message: 12990

The mic that came with the FT100 has an impedance of 2k. My spec sheet on the MD-100 shows the impedance of the mic to be 500 ohms. Wouldn't a 2:1 audio transformer do the match pretty easily? Or am I missing something?

ATAS... Automatic is it's first name, and System is it's last... it works with the FT-100 in a fully integrated way. However, in any mobile environment, especially the motor home, RF grounds are critical. How do you plan to handle that when I assume the motor home is largely Fiberglas?

If the
device rating is 50% duty cycle, then Average Power should not exceed
50% of the max power rating of the rig, which for the FT-100D would
be 50 Watts. I base the 50 Watts on the fact that the key down CW
average output power specification is 100 Watts.

N6AF Chas

Clearly this is for CW and SSB.
Not for FM ?
If not, why not ?
If yes, how long a time could be transmitted continuously ?

# 12995. Re: [FT100] Re: MD-100 Low Audio

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-19 16:52:26 UTC
From: Dr. Gerald N. Johnson, electrical engine
Topic: 12908  Message: 12995

2:1 mismatch in a microphone circuit is a pretty good match. The microphone impedance probably varies more than that over the audio spectrum. A dynamic especially would have that much variation. Besides a 500 ohm microphone feeding a 2K load doesn't have a lot of loss from mismatch. And has good frequency response. A 1:2 transformer would make the match perfect and nearly double the voltage at the input of the audio stages. Most all audio stages have excess gain to easily make that 6 dB.

Makes me wonder if the reports of MD-100 not working with FT-100 come from miswiring.

My earlier note reads:

I believe the FT-100D is rated at 100 Watts PEP, based on a 50 % duty cycle. So you can operate normal CW all day long with it set for 100 Watts output. By "normal" I mean NOT "dead keying" for lots of 15 second intervals while you play antenna, etc. That's not 50% duty cycle. You can also operate all day long in SSB at 100 W PEP.

AM operation is a bit trickier because you have the same PEP as SSB but you have an on-going 25 Watts rms carrier present so that raises the overall effective duty cycle a bit. But I would still say the rig can run AM all day long if you limit the output to 100 Watts PEP.

With FM the whole story changes. Here your average power is the same as your peak power so you must drop the output to 50 Watts on the HF bands; 29.6 MHz FM for example.

For 2 meters and 440 FM, I have to assume that since Yaesu advertises "50 Watts" and "20 Watts" output that they mean FM with no time limit. Personally I run mine at half power usually on 2 meters and 440. You give the PA a bit of a break thermally and you only give up half an S unit.

I think there's a feature that lets the operator disable the transmitter but still hear the side-tone. It was designed in specifically for CW practice. It's a long shot, but hopefully someone turned on this feature. The other possibility is that your're trying to send CW while the MODE is set to SSB. Switch to CW mode. Also confirm that F15 in the sub-menus isn't dialed down to minimum output. Doubtful. Does it send CW on 2 meters? Does it transmit SSB on HF? You can figure out if the HF amp is shot or if you just have it set up wrong. The rig is a great CW performer.

The cw practice option is a possibility. I will try to find out more about that. I am the second owner of this radio although I bought it from a dealer. He is not honoring any warranty. Thanks for your help.

Subject: [FT100] Re: No CW

I think there's a feature that lets the operator disable the
transmitter but still hear the side-tone. It was designed in
specifically for CW practice. It's a long shot, but hopefully
someone turned on this feature. The other possibility is that
your're trying to send CW while the MODE is set to SSB. Switch to CW
mode. Also confirm that F15 in the sub-menus isn't dialed down to
minimum output. Doubtful. Does it send CW on 2 meters? Does it
transmit SSB on HF? You can figure out if the HF amp is shot or if
you just have it set up wrong. The rig is a great CW performer.

Topic: 13001  Message: 13001

I inform .....
Last day, i wrote a message about a problem of noise (wind) of my transceiver Yaesu FT100 when i worked in UHF mode.
I resolved this problem yesterday!
I adjust the VCO with the TC2005. Now it work very well. In the manual service there are reference about level of voltage.
Many thank's for all.

I need other information:

How i can found datasheet about the final power in HF and V-UHF of this radio? (for know the out power)
Can i increase the power with menu? (i think that is not a good idea)
How many power can i use with the ATAS100?
How i can resolve problem with fan speed in V-UHF mode?

Thank's to all.

Thanks, Davis. That might have been what I thought I saw, but I was thinking I saw optimized settings for the normal menu settings, not the hidden ones. I did find optimized audio settings and will try them out. I did the mike mod last weekend and am already getting better reports.

Thanks

Jim

# 13003. Replacement microphones for the FT-100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-20 02:47:50 UTC
From: kraftwerk1976
Topic: 13003  Message: 13003

Hi, everyone. Thanks for helping me out earlier. I do have another question, though. Does anyone know where I can buy replacement microphones for the FT-100? Preferably, something other than the standard Yaesu MH-36 microphone, and something of commercial quality and more durable? Sorry to bug everyone about this, but I have searched and searched the internet to no avail. I should have known that I could not rewire a Motorola microphone to fit the FT-100.

Thanks for your help!

I use the Heil HMM-Y on mine and get excellent reports it has
both the HC-4&5 element in it. I use the Yaseu adapter to fit it to
the radio I believe the part # is CT-69 (I could be wrong on the
P/N). I beleive you can order everything from HRO or AES.

Hello Marco,

The ATAS antenna is rated for 120 watts.

To resolve fan speed (aka fan mod) simply add a 1 watt 29 to 50 ohm resistor to the black fan wire and run it to a ground point.

Run no more than the 100 watts on HF and 6 meters.

Run no more than factory settings for output power on any band...

Dont tamper with the output power at all!! Ciao "Riccardo" N2ZD

> GO BILLS!

I havent installed it yet in the Insight. I have tried it in the new qth but I havent "sowed the land" for the antenna farm yet. I worked a few guys on 20m with a home brew antenna, audio reports good, signal ok. No 1.2 gig module though, not much going on here in the NE. I may install it later on though. In comparison, both have their merits. The FT100 has excellent rx and tx (when modded) and fantastic Audio DSP. Its size and features are as we know a plus..
The Kenwood is way big for mobile installations. Not recommended for those who have to share a vehicle with a spouse if it cant be mounted to avoid damage. Fantastic RX and DSP, the tradeoff is the size. I find the TSB model a little esoteric to use as the manual is mainly for the TS models. If you get one, dont order the mobile bracket as it comes with the free rc-2000.
In addition, the gold rush is on and the sale has depleted all of the current stock of TSB models until June..
Antenna wise, the ATAS was a plus, a no brainer for those looking for an easy antenna installation with the FT100. As we know the Kenwood comes with a tuner but no provision for ATAS operation :-)
I am going to use the atas with a home brew actuator when I finally go mobile. The current selection of Screwdriver antennas are too big for what I need. I dont plan on running a "half gallon" on HF with my Insight and with this in mind the current selection of screwdrivers are quite large in size making them a bad choice for me.
For those who may want one, consider your size concerns before selling your FT100. Believe me, its not an easy task to mount a TSB in your car nor is it worth the swap in my book unless you have good reason to change. The FT100 was VERY suitable for my needs now that I can compare. Believe me, when you do the mods (mic,swr,fan) you end up with one sweet radio thats hard to beat size wise and performance wise.
Dont get me wrong the TS and TSB2k are awesome rigs but very large for mobile use and the fact that I have been spoiled with an ATAS for

three years makes me lean towards ease of operation while mobile.
Regards.. Richy N2ZD

Robby,
First thing you need to do is go to Function row # 8 (WRI, PLY, BK, KYR). Push and hold KYR for 1/2 second and figure out which key you are using EL1 EL 2 BUG if you are using a straight key skip all of this and go to the next paragraph. If you plan on using the electronic keyer chose EL1 or 2(Iambic key). If you chose either EL 1 or 2 hit the function button again and return to the main menu and highlight BK by pushing button C. This will enable the electronic keyer. To use an Iambic (electronic KYR)for code practice just have KYR highlighted and not BK.

To use a Straight key just hit Function row 8 button "C" BK once and it will do its thing. Without BK highlighted you will be able to use the rig for CW practice. This is what it sounds to me like you are doing now.

To adjust to break in push and hold "C" BK button and adjust between Full or Semi break in. Function menu items 46-53 all are used for adjustments to CW mode, to adjust type of key, dot/dash size, CW delay, pitch, break in, speed, and QSK delay.

If you need anymore help please feel free to Email me or post here and I will help any way I can.
73 and all the best

# 13010. Comparisons FT 100 and 706

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-20 17:37:31 UTC
From: ve7baq
Topic: 13010  Message: 13010

Someone was asking about a comparison between the specs on the FT-100 and the IC-706. If you go, to www.mods.dk and click on Yaesu and then on manuals, you can download the ARRL lab report on the FT-100 complete in PDF format (34pages). The IC-706 ARRL report can be obtained at the same site by clicking on ICOM and then manuals. Hope this helps someone.

No Sir this is incorrect.

Duty cycle based on a time duration not power output.
Reducing your power output will however increase your
duty cycle.

Please check this on either the web or engineering
books.

# 13016. Re: [FT100] Re: Hi SWR Icon on 440

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-21 01:59:53 UTC
From: Alek Petkovic
Topic: 12946  Message: 13016

Contrary to what others say on the 440 hi swr thing it is caused by a fault in the internal vhf uhf duplexer. This has been the case with at least 4 units that I personally know of. When my mate's radio and my radio developed the fault we sent them off togther and the service department here in Australia did not have the correct mod kit from Yaesu America. They then rang us and asked if we would mind them making do with locally available components. We said ok. In both cases, the fix was ok for a couple of months and then the same fault happened. We sent the radios back and this time they had the correct kit and procedure to fix the duplexers. It has been good for 2 years now. I had them fit the am filter while they were at it and it is great.

A couple of months ago, I did the resistor mod for the vhf/uhf fans and did the metal strap thing as well. I did not remove the board to drill a hole in the chassis rib. I used the lid cover hole so that when the lid is screwed down, the strap is firmly bonded to the chassis of the radio. Simple.

73 and good luck.
Alek. VK6APK

ps: We are lucky in Australia. On all occasions we delivered and picked up our radios at the local distributor's outlet. They air freighted it across the country at their expense. Turn around time the first time was 9 days. The second time, 6 days. I guess that's why we pay more initially for the radio here.

Greetings fellow FT-100D owners;

The weather has finally let me install my FT-100D in the pickup.
My first contact was with OX3OX in Greenland and a 5X9 report!
After logging over 200 miles on the road during the last 2
days,worked 20 countries and 35 states on 20 thru 10 meters. The
radio tunes the ATAS-100 on the WARC bands quite well also. No major
problems with ignition noise or high swr after the install.

The motorhome is mainly aluminium.

I was to attach it to the ladder rack which in turn connects to the very large roof rack that is on the RV. I've experimented with ali ground planes in the past and they were fine.

I'm still edging towards the SG239 or the LG AT-11

Robby,
First thing you need to do is go to Function row # 8 (WRI, PLY, BK, KYR). Push and hold KYR for 1/2 second and figure out which key you are using EL1 EL 2 BUG if you are using a straight key skip all of this and go to the next paragraph. If you plan on using the electronic keyer chose EL1 or 2(Iambic key). If you chose either EL 1 or 2 hit the function button again and return to the main menu and highlight BK by pushing button C. This will enable the electronic keyer. To use an Iambic (electronic KYR)for code practice just have KYR highlighted and not BK.

To use a Straight key just hit Function row 8 button "C" BK once and it will do its thing. Without BK highlighted you will be able to use the rig for CW practice. This is what it sounds to me like you are doing now.

To adjust to break in push and hold "C" BK button and adjust between Full or Semi break in. Function menu items 46-53 all are used for adjustments to CW mode, to adjust type of key, dot/dash size, CW delay, pitch, break in, speed, and QSK delay.

If you need anymore help please feel free to Email me or post here and I will help any way I can.

Robby,

I'm sure the problem is something simple, but if you still don't have it working by the time ARRL Sweepstakes CW rolls around in November, I'll let you borrow my FT-100 (I'll pay shipping both ways!). VY2 is a VERY rare multiplier in Sweepstakes and it would be a shame if you couldn't get on. Plus you have the perfect call for Sweepstakes :-)

Thanks Bob,

Thanks for the offer. The problem was the BK button. Not clear in the documentation.

If you remind me a week before the contest, I will make a poing of generating some activity from VY2. I use the FT100 in the car. Have a TS-950 and a IC-756 in the shack. So I have no valid excuse.

See you in SS frmo VY2SS.

# 13024. Re: FT-100 Duty Cycle Rating...

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-21 15:56:23 UTC
From: Bob Evans
Topic: 12944  Message: 13024

Robert,

I agree with you in the technical definition of duty cycle, however, Yaesu's 50% "duty cycle" rating is probably designed as a guideline for acceptable levels of total heat dissipation on the unit, not just time off/on. Think about it, by your definition, a key-down FT-100 running 100mW of FM will die at exactly the same time as an FT-100 running 140W FM. That just doesn't make sense. When your engineering books refer to Time on, they are actually assuming that 100% power output is part of that equation.

I prefer the definition of: ((Time on/(Time on + time off))*(% of full output power))= Acceptable heat dissipation duty cycle (AHDDC) for an FT-100. (Time on/Time on + Time off) average duty cycles per mode can be more simply replaced by mode correlated substitutes: CW ~50% , SSB ~33% (no PRO), AM ~66-75%, FM 100%, HF Packet ~33%, V/U Packet 100%, HF Amtor 50%, HF RTTY 50%, SSTV 100%. Then multiply this by percent of full power for AHDDC. I believe there is also one more caveat: Time on should never exceed 10 minutes. (It might be 30 minutes, but I don't have the specs in front of me).

I have personally tested the CW "duty cycle" with 48 hours of continuous operation in CW contests. The rig worked perfectly at 100% output because I was within the 50% "duty cycle" rating (CW 50% * 100% power = 50% AHDDC) and I never went key-down for more than 10 minutes. However, if I get on 2M FM and talk for 10 minutes, the rig would be "toast" (U.S. vernacular for ruined) if the power was set to 100%.

Just a thought...

Hello Group. I have the ATAS mounted on my fiberglass Moterhome on a 'bike rack' put on by the previous owner. Its welded to the frame and has a plate that is about 12" x 18" and hangs about 8' above the ground. Works great! I have also seen an ATAS mounted on the ladder but could not say how well it worked or if it had a separate grounding cable to the frame. 73, Tom VE6TRM

> 73***FRANK***KD3D

Hi Frank and congrads on ur installation. Every so often spray the boot on the atas with silicone spray to keep it pliable and weatherproof. If you start to notice touchy tuning on 17m then its time for a tune up. Simply remove the boot and extend the antenna all of the way up and clean the coil, remove the contact screws and clean and adjust them for positive contact I give it spritz of contact lube and a shot of silicone spray inside the boot for good measure, it has kept mine working FB for 3 years. When you remove the ATAS, from your car grasp it from the base only and not by the tube. Remember to clean and lighty lube the antenna connection every so often. Use a good amount of silicone spray to get the boot back over the black antenna top and while ur at it, remove the stainless antenna and lube inside the hole as this will make removal easier in the future. Mine bonded to the base and its a bear to get apart when it does that. Also make sure you have a good ground at the base of the antenna, this will make the antenna tune better with a local ground. Good Luck Richy N2ZD

# 13027. Re: FT-100 Duty Cycle Rating...

Yahoo group: FT100 (2002-01 — 2002-06)

Just gotta say it one more time - duty cycle in thermal systems is all about long term average developed power, not simply "percentage time 'on'". It is not a simple time ratio except for systems with two power states, full power and zero power.

The key point I made in my post was that the time duration that the unit can be "on" continuously is limited by the ability of the heatsink / fan system to exhaust the heat. In other words, you cannot expect a transmitter which is rated for 50% duty cycle to be able to be "on" for 3 hours and then "off" for three hours and survive. That's ridiculous. The 50% duty cycle rating (or whatever the percentage happens to be) is practically limited by whatever maximum continuous "on" time the unit can handle without exceeding its maximum temperature spec. If the absolute value of the duration of "on" time in the definition of duty cycle was unlimited then "duty cycle" would have no practical meaning for equipment which has less than a 100% duty cycle rating. The "on" time would be completely arbitrary, say 4 days "on" followed by 4 days "off". Sure, it operated at "50% duty cycle" over those 8 days; but after about 32 minutes the finals burned up due to massive over temperature. Duty cycle, when applied to equipment which generates heat is all about power. The average power developed during the subject period must not exceed X % of the peak power rating of the device.

Mathematically:

Average Power = 1/T times the integral P(t)dt, integrated over the time period of measurement, where P(t) is any function of power versus time and T is the period of the measurement. The value of the integration is the total energy developed during the measurement. When the total energy is divided by the time measurement interval, T, you have the average power developed during that interval. If the device rating is 50% duty cycle, then Average Power should not exceed 50% of the max power rating of the rig, which for the FT-100D would be 50 Watts. I base the 50 Watts on the fact that the key down CW average output power specification is 100 Watts.

From: f6dhi
Topic: 13028  Message: 13028

Hi guys....TU for your attention. I've seen on the 1999 QST
Product Review about FT100, it is possible to select the 500 hz
narrow band filter in SSB for PSK use, for exemple. I tried a lot of
things...but nothing !!! I can't use this filter on my FT100D in
SSB !?!?
I use the split mode CW/SSB but not a smart solution !

Any idea ? Tu for your help.

The 100 and 100D are basically the same radio, except the 100D has a somewhat bigger speaker and comes equipped with three "options" that aren't included with the older FT-100. They are: 500 Hz CW filter, TCXO high stability oscillator and CTCSS Decoder Unit.

Welcome to the group. You should find all the info you'll ever need or want to know about the rig right here.

Thanks, Alek. I got a laugh out of that one. I guess the reason I asked the question was because I saw more reference to the FT-100 than to the FT-100D. Again, thanks. I'm looking forward to geting the radio and putting it on the air. It'll make a nice addition along with my FT-920.

# 13034. a better TCXO for the FT-100D?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-22 03:33:59 UTC
From: Tom Tishken KD4WOV
Topic: 12944  Message: 13034

Hello,
Does anyone know where I can get or retrofit a better TCXO for the FT-100D. the TCXO in the D is only 1 ppm. Does anyone know where I can get a .5 ppm TCXO. I am looking at also the possibility of slide on Crystal heater/ovens for all the Crystals to make the FT-100d more stable.

# 13035. Re: [FT100] Re: Am I in the right place?

Thanks, Chas. I should be receiving the rig tomorrow or Monday. I'm sure I'll get a lot of information from the guys on the group. Thanks for the welcome.

Subject: [FT100] Re: Am I in the right place?

The 100 and 100D are basically the same radio, except the 100D has a somewhat bigger speaker and comes equipped with three "options" that aren't included with the older FT-100. They are: 500 Hz CW filter, TCXO high stability oscillator and CTCSS Decoder Unit.

Welcome to the group. You should find all the info you'll ever need or want to know about the rig right here.

Just curious why you want 0.5 ppm. Do you realize that the digital display's least significant digit is only 10 Hz? That translates to a display tolerance of +/- 10 Hz so you already pretty much gave up the "set-ability" accuracy due to that. For example, when it reads 7005.23 kHz you don't really know if the rig is right on the verge of displaying 7005.22 or 7005.24 so there 'ya go; you're already 20 Hz "blind". Guess you could argue that every 0.5 ppm helps. I was just asking what(italicized) it helps! You know what's going to happen if you make that thing perfectly stable? Then the entire ham community is going to appear to be drifting around - might make you kinda dizzy.

Topic: 12944  Message: 13037

when you are on 144 or 432 MHz .5 ppm is .5 x 144 = +-72 Hz or possibly 144 Hz error. On 432 it is +-216 Hz or 432 Hz error. the TCXO in stalled is only 1 ppm(864 Hz error on 432), but that does not count the stability of the mixer and other crystals. I believe there is 3 major crystals ( I could be wrong) in the rig. now multiply your error rate by 3 x 1 ppm you now have a possible 2592 Hz error. Now on SSB 2.6 KHz is a huge error, on FM it makes only a slight difference.

Now you ask does .5 ppm really make a difference? it does on VHF and UHF. On HF the error is a lot smaller, heck you can get by with 5 ppm on HF(except possibly 12, and 10 meters). So so you understand why I want something more stable. the FT-817 has a TCXO of .5 ppm, so why did they not use a .5 ppm in the FT-100d? Hmmm maybe the 9th wonder of the universe.

Marco,

I have the same problem. I don't think the FT-100 filters out the CTCSS tones used to access some repeaters. I found that I can use the band pass DSP filter to eliminate most of the noise. I set menu #19 DSP HPF to a value over 200 to cut out the CTCSS tones. Works pretty good.

Good Luck,

Sean
KC7GSG

From: Bob Evans
Topic: 13041  Message: 13041

Bon jour mon ami,

The 500Hz crystal filter is only available in CW. If you used a 500Hz filter on PSK, you would miss the ability to view all the stations on frequency. I normally set mine to 1800-2000Hz in the software and leave the rig in SSB mode. However, if you REALLY want 500 Hz, you have the DSP filters that work great on PSK. Push and hold the DSP button until the menu changes to LPF. Set the LPF (Low Pass Filter) to the upper frequency that you want (par example 1500 Hz) and the HPF (High Pass Filter) 500 Hz lower (par example 1000). I think you find it works quite nicely if you need a filter for PSK.

I hope to see you on 20M!

A bientot et bon chance,
Bob K5WA

# 13046. Re: [FT100] Re: DC Cable now ATAS 100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-22 04:12:12 UTC
From: robert blumenkranz
Topic: 12983  Message: 13046

I use the ATAS on my 30 ft motor home and it works
fine now that I redesigned the ATAS internal DC
control board. Be careful and test the antenna first
before you put it up as mine out of the box would
change direction after nulling at the SWR dip, just
enough reverse motion to throw off the SWR depending
on which direction the antenna was going. Component
tolerances inside the antenna control can be off far
enough when using the FT-100D that will make the
antenna fail due to the range of the voltage coming
out of the FT-100D, if you have the problem which
appears to me to be a marginal component tolerance
design flaw. I estimate it will effect 20 to 30 % of
all ATAS antennas.
Good luck,
Bob NI6R

From: Tabby Francisco
Topic: 12944  Message: 13047

I'm planning on getting an ATAS-100 but with the price
of that mobile antenna, I can buy an FC-20 and add a
hamstick for mobile operation.

With the FC-20, I can also use that for tuning dipoles
or omni's back home.

What is the better choice? Help guys!

# 13048. Re: a better TCXO for the FT-100D?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-22 19:11:50 UTC
From: backhoefade
Topic: 12944  Message: 13048

I just looked at the spec' sheet and it appears that the +/- 1 ppm stability number pertains to the transmit signal. I also just read part 97 and couldn't find any quantified transmit frequency stability requirement. The main thing, legally speaking, is to stay within the band limits. (If you want to really split hairs on that the application of the law would have to be per the spurious signal limitation which states that any spurious emission must be 40 dB below the mean power of the fundamental emission. That means that you could operate any mode as close to the band edge as you can get without violating the -40 dB rule beyond the specified band edge).

Your worst case calculation assumed an 864 Hz contribution from each additional crystal oscillator but you should base each 1 ppm contribution (the 1 ppm itself is and assumption) on the fundamental frequency of those additional oscillators which is probably well below the 400 MHz area.

But the point is that the tech' spec's state an "overall" 1 ppm stability over temperature. It doesn't really matter legally as long as you stay far enough from the band edge. You would base that "margin" on the published stability spec which is +/- 1 ppm for SSB, CW, AM and +/-(1 kHz +1 ppm) for FM. So let's figure out the worst scenario. It would be at 450 MHz: 1 kHz plus 450 Hz so that's +/- 1450 Hz. Plus you have to throw in the display tolerance that I mentioned previously which is +/- 20 Hz so the grand total is +/-1470 Hz. Plus, for FM, you better throw in the deviation; let's assume the 40 dB down rule is met at +/- 3 kHz (based on "5 kHz" deviation). So that's +/- 1475 Hz. So to play fully legal you want to leave about a 2 kHz margin with respect to the band edge at 450 MHz. At 14 MHz SSB the contributions are: +/- 14 Hz (the 1 ppm spec) plus +/- 20 Hz (read-out tolerance) plus about +/- 3.5 kHz roughly for the 40 dB down sideband spreading. Worst case on the latter is when you've chosen the sideband that extends towards the nearby band edge. It's interesting that the dominant contributor is the sideband spreading in the SSB case.

I think the reason for the +/- 0.5 ppm spec for the FT-817 is just that it's likely to be in a harsher temperature environment, but pactically (and legally) speaking it doesn't buy you much. You could operate a bit closer to the band edge. But the operating range over which the FT-100D can hold the +/- 1 ppm performance is spec'd from 14 F to 122 F. I think the limiting "stability factor" under those conditions may be the operator himself!

Someone else can chime in on whether the +/- 1 ppm performance is a hindrance to digital operation and satellite work (or the combination

of the two).

Time for another cup of coffee.

Date: 2002-03-22 20:28:33 UTC
From: Dick Thompson
Topic: 12944  Message: 13049

Up until a month or so ago, I used Hamsticks on my base station. I recently installed a Hustler 4BTV Vertical, and still use the Hamsticks on the bands the Hustler won't cover. They work extremely well.

I would like to get the ATAS antenna, but the cost right now is more than I care to spend. I am still awaiting arrival of my new FT-100D. So, the Hamsticks will be the antenna I will use. They are a great little antenna, but it's a matter of choice and how fat your wallet is. Having just bought a new FT-920, Logikey K-3 Keyer and the FT-100D, my wallet is anything but fat. It looks like it was hit by a truck. And, if add the fact that I want to spend another $300 +/- to the XYL, I'll look like I've been hit by a truck. You never want the wrath of an Irish woman to descend upon you.
:)

Good luck & 73,

Dick

Lately I have been noticing while chatting on 2 meter FM, that my power indicator is sometimes delayed...and just found out that the radio sometimes isn't transmitting it's set power...it's putting out a far reduced signal! It could be 1/2 second to a full second before the power level goes to full...and a couple times today it didn't go up at all. I went away from the radio for a little while and turned the power down to about 30% and then didn't see any problems...

I do not have a high SWR. Are my finals going? If so, can I stop it? How? I really don't want to be without my FT-100

The FC-20 is not the greatest of tuners. It does a good enough job on a G5RV
but it will not really do anything over 3:1

Think of it as an automatic antenna TRIMMER

My vote is ATAS-100

# 13054. Yaesu repair...

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-23 00:57:28 UTC
From: n1evh
Topic: 13054  Message: 13054

Well back in 1991... I had an FT-727 dual-band HT that went back and forth between California and Massachusetts 5 or 6 times in the course of 9 months. When I sold that radio, I told people I would never buy another Yaesu radio. Well over the past 4 years... I've bought either new or used... 10 Yaesu radios.

Well today... I think I am now realizing why I said I would never buy another Yaesu radio.

I sent my FT-100 in back on Dec 17th. According to the UPS web site, they received it Dec 26th. Since I haven't heard a thing about my radio... I called Yaesu about it today.

Now I sent my radio in cause there was no power output on HF/VHF/UHF. I was told by the person that I spoke to that the estimate to fix my radio was about $680 !!!!!

They said they wanted to replace the power amp board (about a $270 board), the CPU (about $80), some other misc parts, and $200 labor (at $70/hr).

Now needless to say... I wasn't happy to hear that. I told them that for $150 more... I can go out and buy a new FT-100D (HRO has them for $1029... with a $200 special/coupon for a final price of $829).

They had a tech call me back (not the tech that did the estimate on my radio). As I spoke to him on the phone, he looked at the estimate and I heard him say something like "now why does he want to replace that". He then spoke to the tech that did the estimate and called me back. He said now it appears that the CPU doesn't have to be placed. So I asked him what are we talking about now for an estimate. He said he would talk to the tech again and call me back on Monday.

So now I have to wait to see what this new estimate will be to fix my 2 year old FT-100.

From: D Vande Vusse
Topic: 13028  Message: 13057

This is what digital (DIG) mode is for. In digital mode you can select either the 2.4 or the 500 Hz filter. The connection from the computer to the radio is via the Data jack. You have a separate transmit level via menu item 28 AFSK LEVEL. The side band is set by menu item 34 AFSK MODE. The only difference I have found between RTTY and PCT is a very slight shift in where the 500 Hz band pass is located. The frequency displayed on the radio assumes a 2120 Hz tone PSK 31 signal. The IF shift can be used to move the 500 Hz window up and down, allowing you to remove a nearby strong signal on one side. The transmit uses the wide filter so even if you IF shift down to 1000 Hz you can still transmit. I have found the 500 Hz filter works slightly better where Yaesu puts its up at ~2000 Hz.

Most radios will adjust the AGC to the strongest signal in the band pass. Using the 500 Hz filter I can make a weak PSK 31 station strong by removing the other signals from the band pass. I really notice a difference on 40 and 80 meters, weak signals will become readable just by the reduction in background noise provided by the 500 Hz filter.

The data jack provides a constant level signal to the computer, I used a 1:1 transformer, no level adjustment required. The volume control has no effect. DSP also has no effect on the audio from the Data jack.

I had to reduce the transmit level audio with a 20K pot. I set the level so with the AFSK LEVEL set to 100, I was transmitting 30 watts. I use the AFSK LEVEL to control my transmit power.

I just use a single transistor for the PTT, no isolation.

The DIG mode provides a separate connection for audio and PTT, constant audio out, separate transmit level control, and two filter selections! I can switch from voice to digital modes without having to change connections or adjusting voice settings on the radio, just press the MODE button.

Radio Shack sells the Data port connector over here.

Try DIG mode. The FT100(D) is a great digital mode radio using these features. MSFK16 fits nicely in the 500 Hz filter and you hear nothing else.

Buy an SGC or similar tuner instead to go with the Hamsticks. You then have a tuner that will work with any (100 watt) radio and match a larger variety of loads. It will not limit you to operating on 40 metres and above as does the ATAS. You will find that you can probably use a 20 metre Hamstick on all bands from 80 through to 10 metres if you don't want to change the antenna. You will get better performance with an antenna designed for the band you are on, but you will be surprised how well the 20 metre one will work on other bands. Tuning is almost instant if you have been on that frequency before, with the same antenna because of the memories in the SGC tuners. I'm sold on my SG239 and 20 metre home made whip, especially as I need 80 metre mobile operation!

Shame Shame,

You have just informed us that you didnt read the message archives related to the FC-20. Forget it, its great for propping up the front of your FT100 and the case looks spiffy but in all actuality, dollar for dollar>>>>>it stinks<<<<<. You will be much better off with the ATAS 100, or Ham Sticks with an SGC or LDG brand tuner. Dont get me wrong, the FC-20 will match an antenna resonant for a particular band or maybe a band or two away if you are lucky, but the SGC and LDG have a much broader tuning range and will allow you more flexibility in antenna choices.
I liked the ATAS for 40m thru 6m operation, sure its a compromise, but anything short of a 90 foot Tower and beam is anyway.. For the mobile, I recommend the ATAS. I ran mine three years without any problems besides maintaining it and explaining what it was to non-hams. If you decide to change bands, its much easier to do when mobile when compared to changing ham sticks and messing with an outbacker etc.. Thats my opinion on it and we all know what opinions are like and what they smell like too :-) .. Regards.. Richy N2ZD

I agree,

If you want something that costs heaps and works half as good as the
others, get the FC-20.

If you want something that you'll find useful for many years to come, take
the advice of these guys.

I can personally vouch for the LDG tuner. I consider it to be one of the
wisest purchases I've ever made for ham radio.

You of course are free to buy what you wish but you did ask the advice of
others. Please think before you buy.

73 and happy ft100ing. Hmmm is that a word?

Sounds Like you have cut back due to a heat problem. is the fan coming up to speed when you transmit, check the SWR with another meter. I use a rule of thumb, using a bird watt meter that if the reflected power is LESS than 5% of forward pwr then its passing in my book for 30 MHz to 1000 MHz. The techs that worked for me could speed to much time on a job trying to get it down to nothing reflected thus cutting down profits on jobs etc. Also take the cover off and make sure that the chassis screws are tight ( not overtly tight) holding the ckt board in and also ck the screws hold the finals to the heat sink. I believe that the finals have a built in thermo cut back ckt built in to the module. THERE ARE OTHER THINGS THAT CAN CAUSE A PROBLEM SUCH AS YOURS BUT THE ABOVE IS SOME OF THE COMMON ONES.

Hi Alek,

I've been reading the thread on the comments about the FC20 vs the SDG or LDG Tuners. I've never considered the FC20, but I am awaiting arrival of a new FT-100D for my mobile/portable operation. Now my question: Is the LDG or SDG a small tuner that is conducive to mobile operation? I assume they are automatic. I have Hamsticks and Hamstick knock-offs that work quite well. My goal is to buy the ATAS antenna, but not for a while. So until I do, I'll be using my Hamsticks on a mirror mount. I'm also considering a tri-band mobile antenna that will operate 6/2/430 for local stuff. Any suggestions on that? I'd like something that would screw onto an NMO type of base. Is there such an animal?

# 13065. Re: a better TCXO for the FT-100D

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-23 17:47:53 UTC
From: Bob Evans
Topic: 13065  Message: 13065

Chas,

I don't have a TCXO at all, but I sure found a need for one recently while working HF (30M) packet from ZF1A. I was linking to a stateside DX packet cluster and found that my FT-100 drifted 30 Hz in the first hour or so. My concern was not band edge limits, as you pointed out, but simply stability on any particular frequency so that I could stay linked to the other station. I used 500Hz filters on both ends of the link (I used the FT-100's CW mode in an A/B vfo split mode) because I wanted to minimize compromises to the link. I noticed that the FT-100 would loose the link. I realize there is also drift on the other end of the link, but we confirmed a majority of the drifting being FT-100 by comparisons with an IC-765, TS-850 and FT-1000MP. I sure could have used a good TCXO to keep me connected longer.

That being said, I never noticed any drift on CW, SSB and FM (obviously), but I can sure agree with Tom, KD4WOV, that an excellent TCXO is mandatory for UHF digital work. I'm sure 30 Hz HF drift is within spec for a non-TCXO FT-100, but you'd absolutely need better for UHF work.

73,
Bob K5WA

Topic: 13065  Message: 13066

Also if your using a DSP along with narrow CW filters, you can actually drift in and out of the audio pass band of the DSP and narrow CW filters. the narrower the filter or mode the less tolerant the link will be. For instance lets say you were using a packet type system using 1200 and 1900 Hz tones. if your receiver/demodulator has a tolerance of -+30 Hz (assuming your not using FM) then a drift up or down of more than 30 Hz will affect your link. this does not count phase differces due to multipath and signal fading. As you rightly stated the better your stability the better off you are. PSK32 and other mode just like it are very narrow. I would have to look it up, but does anyone know the bandwidth of PSK32?

From: wb8vlc
Topic: 13052  Message: 13069

There is no thermal protection for either final, if the heatsink cannot dissipate the power then the final V/U will be destroyed. You need a fan on the radio that works in V/U and or lower your power and use the timeout timer set to 1 minute.

Mike

Topic: 13071  Message: 13071

I am the proud owner of a FT-100 (no D), serial starting with 9J10. I acquired it brand new in May of 2000 as a graduation/upgrade to General present, and it installed in my vehicle with a dual 2m/440 antenna until I could afford the ATAS. For about a year I used it almost exclusively on 2m. My father gave my the ATAS-100 for my birthday last year, but unfortunately he died while it was in transit, so for awhile ham radio wasn't a high priority in life. However, now I have finally got my radio permanently installed and operating with the ATAS and my dual bander (I like the two separate antennas better, personally), and so far I'm very happy with it!

However, I came across this group and have been reading about problems with heat and such... is my particular radio series at risk for these issues, since it was one of the earlier releases? Also, since the radio is mounted in my trunk, with the remote head up front, are there any extra measures I should take to ensure better cooling? Living in Texas, the climate is about to be VERY hot on a daily basis when summer creeps in.

With all the confusion of the multiple threads and such, and the uncertainty of whether or not I NEED to do anything, I would really appreciate a little bit of personalized advise. I certainly don't want to burn out my rig now that I finally have it working the way I want it to!

Thanks so much in advance! It looks like a great group running here - and I plan to post some pics of my installation here once I pretty everything up.

Try the following:

www.sgcworld.com

They have agents listed throughout the USA and the world.
I found the agent for New Zealand on their site so bought mine from him. His price was good and I prefer to deal with an agent in New Zealand if possible, as long as the price is ok!

Good luck,

Grant, ZL2BK.

# 13073. FT100 & 6 meters

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-24 08:57:57 UTC
From: Louise&JanPieper
Topic: 13073  Message: 13073

Hi all,
Does anybody outthere has some experiences with a inverted V on 6 meters?
I bought a MFJ948 tuner for HF, and it is working fine over all bands, even 6 got tuned, but is deaf to the end.
Next question: I can't find out why not, but would a inverted V standing upright as a V work the same way as
an inverted V ? I am busy making one of two 5/8 lambda 2 meter mobile antennas, as they are shortened
1/4 waves for 50 Mc !! Looks good on top of a car !

Re. mods.

I am also interested in IF and WHAT mods were done in the year your rig was manufactured. I have a FT-100D and serial number 9K12- indicating Sept 1999 as year of manufacture, just a month after yours. If you get hold of the service department, please post your results as it might help a lot of people. When I took the covers of my FT-100D I thought I could see the mods the various post indicated but there might be something I missed.

Thanks

# 13077. SPEECH COMPRESSOR for the MH-31 from W4RT Electronics

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-24 16:38:47 UTC
From: w4wb
Topic: 13077  Message: 13077

For all of you that have been asking us when the "One BIG Punch" speech compressor for the Yaesu MH-31 microphone will be available, I am happy to announce that it is now ready for shipment. It is available in two ways.

First way is to send your MH-31 to W4RT Electronics and we will install the One BIG Punch for you. Turnaround time in our shop should be no more than one business day as is typical of the One Board Filter installations that many of you have already.

The second way is to install the One BIG Punch into your MH-31 yourself. Before you take this path, please read the instruction manual that is available as a download (Adobe pdf file) on the W4RT web site (www.w4rt.com). Installation requires a modest amount of skill.

You can purchase the One BIG Punch from either W4RT Electronics (www.w4rt.com) or GigaParts (www.gigaparts.com). Installation will be by W4RT Electronics in either case. GigaParts and W4RT Electronics are located a few miles apart.

The One BIG Punch was designed to provide a significant increase in talk power while maintaining good audio quality. For example, if you also have the FT-817, combining the One BIG Punch with the optional SSB filter (One Plug Filter or the One Board Filter) provides even more of a PUNCH!

Guy: I have 2 FT-100's (no D)and here is my experience. They have both been back to Yaesu for the SWR mod. One is my mobile transceiver (June 2000)and I use it on 2M and 70CM FM using a diamond dual band antenna and mostly on 17M but have used it a little on 20, 15 and 10M using hamstick antennas. My base station (Nov. 2000) us used mostly for 2M FM and a little 70CM and is turned on at 06:30 in the morning and off around 23:30 using a hustler fixed dual band antenna. Neither of these have the fan mod. in them. The base rig being on 2M FM on just receive gets a little warm, my FT-800 got MUCH warmer for the same duration, but dosen't seem it is that hot to cause a problem at least it hasn't in a year and 4 months of operation like this. The fan mod would be a good idea but haven't got to do it yet.
Hope this helps. John K2GVP

Ham sticks (and clones) work extremely well with the FT100, an excellent choice if you prefer to "hang" on one band or with a tuner you can usually squeeze a band or so off from where it is resonant. The LDG brand will auto tune if I remember correctly and the new model has an optional head unit you can mount up front. The SGC I dont know, I havent had one but its highly rated on EHAM.com and some guys run it in here with a whip. I had the LDG (older version) but I opted to keep the ATAS as it worked well for me so I sold the tuner to a friend. Both are excellent choices and the SGC people make larger ones for those that choose to run some juice from the mobile. Regards.. Richy N2ZD

PS Check out Comet and Diamond as I believe they make triband UHF and VHF antennas in most of the common mount types..

Thanks for the information. I have been using Hamsticks on my base station FT-920 and they work well. I think that once you have the Hamstick tunrd and know the frequency range per band, a tuner may not be necessary.

I'm waiting for the arrival of a new FT-100D (hopefully today or tomorrow), and plan on using my Hamsticks until I can get an ATAS or something similar. I'm a bit confused as to what to do. I knw I will probably get a tri-band mobile antenna for 6/2/430, but want something I can use to run mobile on the HF frequencies.

Do you know the URL address of where I can get more info on the LDG tuner?

Tnx & 73,

Dick

Yes

>
> If so, how difficult is it to do? Is a modification required, or can you
> just select the right menu option?

It involves taking off the cover to the control head and unsoldering a chip resistor, then restarting and dialing in 2 very obscure frequencies and facing left, making the odd Vulcan peace gesture, genuflecting towards Japan, and resetting and losing all memories.

http://www.mods.dk

go to the purple Yaesu button on top, then the FT100 button on the left, then the top link in the right pane "Transmit coverage for FT-100 English language"

I was in the office this morning listening to Seattle Approach to SeaTac Airport (133.65). All of a sudden the FT100 started beeping.
I looked at the screen and in the upper lefthand corner, where the "IFT" shift icon and "DSP" would show up, there was a large circle with a checkmark in it and the letters APO underneath. Its still beeping ... over the top of still normal volume flight conversations.

I shut the power off, turned it back on and all is well.

Any idea what this is, oh group of infinite wisdom ...

Thanks

John - WB0RLD

Thanks for the information. I have been using Hamsticks on my base station FT-920 and they work well. I think that once you have the Hamstick tunrd and know the frequency range per band, a tuner may not be necessary.

I'm waiting for the arrival of a new FT-100D (hopefully today or tomorrow), and plan on using my Hamsticks until I can get an ATAS or something similar. I'm a bit confused as to what to do. I knw I will probably get a tri-band mobile antenna for 6/2/430, but want something I can use to run mobile on the HF frequencies.

Do you know the URL address of where I can get more info on the LDG tuner?

Tnx & 73,

Dick

Subject: [FT100] Re: ATAS-100 or FC-20 + hamstick?

Ham sticks (and clones) work extremely well with the FT100, an excellent choice if you prefer to "hang" on one band or with a tuner you can usually squeeze a band or so off from where it is resonant. The LDG brand will auto tune if I remember correctly and the new model has an optional head unit you can mount up front. The SGC I dont know, I havent had one but its highly rated on EHAM.com and some guys run it in here with a whip. I had the LDG (older version) but I opted to keep the ATAS as it worked well for me so I sold the tuner to a friend. Both are excellent choices and the SGC people make larger ones for those that choose to run some juice from the mobile.
Regards.. Richy N2ZD

PS Check out Comet and Diamond as I believe they make triband UHF and VHF antennas in most of the common mount types..

Now my question: Is the LDG or SDG a small tuner that is conducive to mobile operation? I assume they are automatic. I have Hamsticks and Hamstick knock-offs that work quite well. My goal is to buy the ATAS antenna, but not for a while.

# 13090. Re: [FT100] FT100 & 6 meters

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-25 21:29:24 UTC
From: Alex Turner
Topic: 13073  Message: 13090

My experience has been that with 6 meters you get to listen to many hours of nothing. If there is a beacon station close to you you might try tuning it just to verify that everything works.
when an opening occures it is amazing the stations that you will hear and be able to work with simple antennas and low power then it will go quiet again. If you are not experienced there with 6 meter operation there is much info to be found on the Internet. After awhile you will see why it is referred to as the "magic" band.

Hi all,
Does anybody outthere has some experiences with a inverted V on 6 meters?
I bought a MFJ948 tuner for HF, and it is working fine over all bands, even 6 got tuned, but is deaf to the end.
Next question: I can't find out why not, but would a inverted V standing upright as a V work the same way as
an inverted V ? I am busy making one of two 5/8 lambda 2 meter mobile antennas, as they are shortened
1/4 waves for 50 Mc !! Looks good on top of a car !

You have enabled, in the menus, the Automatic Power Off function that shuts
off the radio after 1/2/3 hours of no panel adjustments.

I have had great success working 6 meters with a G5RV Junior in an inverted Vee configuration. When the band is open I receive 5-9 reports often from Nova Scotia. I'm in the SF area so that's a pretty good haul with just the barefoot FT-100D.

Hey Guy,

Firstly, my condolences on the loss of your Dad, I lost my dad when I was 21 and my Mom at 24. At 34 I buried a child so I can identify with you on the lack of hamming and such. I hope you are doing well now..

With that outta the way, I can tell you that your radio most assuredly doesnt have any of the mods and a call to Yaesu as mentioned will get you no further information as they "bend the truth" from what we have determined here.
If the radio is out of warranty, check with Yaesu to see if they will cover the mods if its returned, specify in writing that you need the Fan Mod and the SWR mod. The fan mod will cool things down inside the rig and the SWR mod will make the radio more stable on HF and as reported, clean things up on UHF and VHF as well.
If you want to do the mods yourself, check out the files and photos area to the left of the website page.. Regards. Richy N2ZD

Scott I haven't had the problem but the answer to most ATAS problems is grounding, grounding, grounding. Be sure the antenna mount is well grounded to the body. Mag mounts won't do it. Many trunk lids ride on nylon bearings and are isolated from the chassis -- they need a ground strap. 73 Radio K4IA Craig "Buck" Fredericksburg, Virginia USA QRP ARCI #2550 FISTS #6702 CC 788 Diamond #64 K1 #470 K2 #2460 fpQRP #442 QRP ARCI #2550 ---------- For cheap long distance, 800#s and more Tune to http://www.ld.net/?bucksavers 4.9 cents/min - no monthly fees [Non-text portions of this message have been removed]

# 13098. Re: SPEECH COMPRESSOR for the MH-31 from W4RT Electronics

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-26 13:38:46 UTC
From: w4wb
Topic: 13077  Message: 13098

Hi Dick,

The One BIG Punch should work fine with the FT-920 since it comes with the MH-31. I have not tried to put the OBP into the MH-36 microphone yet with my FT-100D. There is also the matter of the FT-100D's on-board processor and how the OBP would sound with both being used. I also have a FT-1000MP and tried the OBP with it with ALL of the MP's processing off. Worked fine. Normally, I use a Heil Goldline with the Studio element with my MP. I have the MP "tuned" (it has lots of things to tweak) for good audio and lots of punch. With the Quadra amp, my peak power is 1000-1060 W and the average power is 800-850 W!

The only other item we make for the FT-100D is the One-Touch Tune module that allows the simple generation of a tuning carrier. If you have a LDG AT-11MP or RT-11 (or AT-11 with the 706 mod) and the One-Touch Tune, all you have to do is just press the tune button on the tuner and the rest is automatic. Can also use with manual tuners and other autotuners with perhaps a little mod to them (get the command signal out). BTW, the CAT is still available unlike with the Yaesu tuner. See www.w4rt.com.

# 13099. Re: ATAS-100 won't tune on 10m ?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-26 14:48:00 UTC
From: Bob Evans
Topic: 13095  Message: 13099

Scott,

Relax, you're in good company on that problem. There could be many reasons for not tuning 10M, but almost all of them are related to your antenna installation not quite being finished yet. I had the same problem myself and ended up adding a 2" wide braided grounding strap from the antenna mount to the car chassis (not just some convenient body sheet metal). The next thing I did was to replace the coax on my Comet mount. Comet just used a compression fit connection to attach the coax to the mount and it wasn't enough, it needed to be soldered, on both ends, for a better contact. That will probably get you running with great SWR.

The other possibility (which I think is only a 2% probability, even though some guys on here swear by it) is that you may need the internal grounding mod, commonly referred to as the "SWR" mod. Do this one only AFTER you've done the others AND you've tried the rig on a known fixed station 10M antenna (or dummy load) where the SWR problem shows up just like in your mobile installation. I have never had to do this mod on my old FT-100 and it has worked like a champ from day one, but I had to spend quite a bit of time getting the mobile antenna mount "right".

Good luck, it will be worth the effort!

Bob,

Do the new T-100D's have the grounding/swr mod done already at the factory? (I know, I'm dreaming and living in a fantasy world). I just got my new 100D last night and it works fine, but its main use will be mobile and in my camper this summer.

If it isn't shipped with the mod, where can I find out about the mod and how to do it?

Thanks,

Dick

Scott,

Relax, you're in good company on that problem. There could be many reasons for not tuning 10M, but almost all of them are related to your antenna installation not quite being finished yet. I had the same problem myself and ended up adding a 2" wide braided grounding strap from the antenna mount to the car chassis (not just some convenient body sheet metal). The next thing I did was to replace the coax on my Comet mount. Comet just used a compression fit connection to attach the coax to the mount and it wasn't enough, it needed to be soldered, on both ends, for a better contact. That will probably get you running with great SWR.

The other possibility (which I think is only a 2% probability, even though some guys on here swear by it) is that you may need the internal grounding mod, commonly referred to as the "SWR" mod. Do this one only AFTER you've done the others AND you've tried the rig on a known fixed station 10M antenna (or dummy load) where the SWR problem shows up just like in your mobile installation. I have never had to do this mod on my old FT-100 and it has worked like a champ from day one, but I had to spend quite a bit of time getting the mobile antenna mount "right".

Good luck, it will be worth the effort!

Thanks, Barry. Appreciate all the information. I have the FT-920 and I get great audio reports using the MD-100 mike. Someday I may add the Heil Headset mike.

I'll check out the web site.

Subject: [FT100] Re: SPEECH COMPRESSOR for the MH-31 from W4RT Electronics

Hi Dick,

The One BIG Punch should work fine with the FT-920 since it comes with the MH-31. I have not tried to put the OBP into the MH-36 microphone yet with my FT-100D. There is also the matter of the FT-100D's on-board processor and how the OBP would sound with both being used. I also have a FT-1000MP and tried the OBP with it with ALL of the MP's processing off. Worked fine. Normally, I use a Heil Goldline with the Studio element with my MP. I have the MP "tuned" (it has lots of things to tweak) for good audio and lots of punch. With the Quadra amp, my peak power is 1000-1060 W and the average power is 800-850 W!

The only other item we make for the FT-100D is the One-Touch Tune module that allows the simple generation of a tuning carrier. If you have a LDG AT-11MP or RT-11 (or AT-11 with the 706 mod) and the One-Touch Tune, all you have to do is just press the tune button on the tuner and the rest is automatic. Can also use with manual tuners and other autotuners with perhaps a little mod to them (get the command signal out). BTW, the CAT is still available unlike with the Yaesu tuner. See www.w4rt.com.

# 13103. Power cord connectors for FT-100D

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-26 15:42:28 UTC
From: wb0dul
Topic: 13103  Message: 13103

Does anyone know where I can get a set of power cord connectors like those that are on the FT-100D? I called HRO and they don't sell just the connectors. All they have is the complete power cord that mates with the pigtail coming out of the FT-100D. He said there is only one in the entire company and they are asking $33.00 for it. (He said he thinks it may be gold plated. Hi Hi). He suggested checking with you guys as maybe someone has found a set and didn't have to pay an arm and a leg to get them. The other alternative is to change the connectors to something more readily available. All I want to do is put a connector on the end of the wire I currently have coming from my truck battery.

Hope someone can help.

73,

Dick

# 13105. [FT100] Power cord connectors for FT-100D

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-26 15:54:48 UTC
From: Kirby Hylton
Topic: 13103  Message: 13105

As Pres suggested, I recommend the good products at Powerwerx.com. If you order from them, make it a big order, since shipping is considerable.

When I first purchased my FT-100D, I also bought a spare power cable. When I recently wired my wife's Jetta, I used the FT-100D connector from powerwerx.

FWIW, if you do a lot of automotive aftermarket wiring, I recommend www.wranglernw.com. If not just for their selection of automotive wiring and connectors, their catalog alone has been a great help (the website is sort of cumbersome to search on; download or request a print copy of their catalog). Their shipping charges are very minimal.

Enjoy your FT-100D. It's a great radio. I'm looking forward to getting mine back from Yaesu in a few weeks.

Scott,
Grounding, of course is essential, at the radio. Its
also essential to get all the car metal tied together
to form one ground.

I use an MFJ mag mount on the trunk of my 99
Bonneville and it works ALL bands beautifully. What
WAS critical was the coax length from the mount to the
radio.

I added about 8 ft of coax to the MFJ 17ft in order to
get a ground at the antenna. That messed everything
up. Could no longer load on 15,17 mtrs or 24 mtrs. I
surmised from that that the 17ft was critical. Went
back to 17ft and everything worked again. Coax length
is very important. I know 17ft works with the ATAS.

Yaesu sells the bare plugs, for the cable or radio end, for $4.30
each.
Best price i've seen for them. I got got them from the Ceritos office.

Topic: 13095  Message: 13108

You should not have to fiddle with the feedline in order to get a good SWR. Most likely you are getting the dreaded spurious oscillation problem that will kill your final amplifier if you let it go on long enough. Try keying up on 10M SSB without any audio input to the microphone. Does the meter show any RF output? If it does, you've probably got the oscillation problem, and will need to send the radio to Yaesu for the grounding mod. In my case I'd get 80 watts of RF out, despite having no input audio on SSB and the HI SWR icon being lit. The RF foldback circuitry is supposed to clamp the power to 10 watts at high SWR, but the spurious oscillation was occuring beyond the point where the foldback circuitry has control of power output.

By the way, I just got my FT100 back (for the second time) after the "Hi SWR" / spurious oscillation mod, and it appears to be working great on all bands. Time will tell if the mod really worked - last time it worked a few weeks and then gradually got worse, occurring on more bands as time passed.

If you have the base of the ATAS well grounded to the body AND the whip is in the clear, not close to the body, it should tune. I run mine on a blazer, suburban and moterhome. The MH is the only one that had a minor problem because it was only grounded to the steel tube frame. The rest is fiberglasS. 20M took a couple of ferrite beads to de-couple the RF from the coax. 6M took a couple of 1/4 wave ground plane straps on the roof.
If the radio has not got the ground strap mod inside it 10M is the first place that the resulting oscilation shows up. Mine tried to radiate at 13MHz instead of 28.5 MHz. The ATAS can't tune etc. I confimed this by holding a hand held freq meter above the car roof. It read 13 MHz.
Good Luck
Erwin

Scott: One approach that has worked on both of my FT100's is to put a ferrite choke (donut) under the ATAS100. Just wrap 3 or 4 wraps through and around the donut close to the base of the ATAS100. That has helped stomp out the
dreaded HI SWR icon....Dale KC2PZ

First thing to do is check if the ground strap mod has been done. It can't be the adhesive copper tape either. Gotta be screwed into the rib. If not then it's "off to Cerritos" we go. The other thing you can try is place a dummy load at the end of the coax in your mobile set-up.
Just place the dummy load where your antenna would be, with the coax running as you plan. If you see the "SWR Gremlin", then it's "off to Cerritos" you go. It's really crazy how some people don't want to believe that the problem is often inside the rig. You should be able to run that rig, without any grounds what-so-ever through any length of coax to a dummy load without the SWR behavior happening. It's a 13.65 MHz spurious oscillation. Until I had mine modded I couldn't operate on 10 Meters with any antenna at all. So I looked at the rig with a spectrum analyzer and saw the spurious oscillation. Now who thinks that it's normal to have to add a bunch of external grounding in order to not have a spurious oscillation occur. Come on!

John,

I may be missing something here, but where, on the back of the FT-100D do you connect a ground? It's one of the first rigs I've ever seen that didn't have a ground lug on the rear of it.

From: Dick Thompson
Topic: 13103  Message: 13115

Thanks, Kirby,

I'll check out the site you recommended.

What bothers me about the FT-100D right now is that everybody seems to be having to send them back to Yaesu for this mod or that mod. What I'd like to know is why in the heck doesn't Yaesu just build the "mod" into the radio when they make it and save everyone a lot of hassle?

Is this Hi SWR mod something that a guy can do without sending the radio to them?

Thanks again,

Dick

Subject: [FT100] Power cord connectors for FT-100D

As Pres suggested, I recommend the good products at Powerwerx.com. If you order from them, make it a big order, since shipping is considerable.

When I first purchased my FT-100D, I also bought a spare power cable. When I recently wired my wife's Jetta, I used the FT-100D connector from powerwerx.

FWIW, if you do a lot of automotive aftermarket wiring, I recommend www.wranglernw.com. If not just for their selection of automotive wiring and connectors, their catalog alone has been a great help (the website is sort of cumbersome to search on; download or request a print copy of their catalog). Their shipping charges are very minimal.

Enjoy your FT-100D. It's a great radio. I'm looking forward to getting mine back from Yaesu in a few weeks.

Thanks, Chas. It's rediculous that Yaesu can't ship the radios with the "mod" already done. It would probably cost them less than a buck to do it.

First thing to do is check if the ground strap mod has been done. It can't be the adhesive copper tape either. Gotta be screwed into the rib. If not then it's "off to Cerritos" we go. The other thing you can try is place a dummy load at the end of the coax in your mobile set-up.
Just place the dummy load where your antenna would be, with the coax running as you plan. If you see the "SWR Gremlin", then it's "off to Cerritos" you go. It's really crazy how some people don't want to believe that the problem is often inside the rig. You should be able to run that rig, without any grounds what-so-ever through any length of coax to a dummy load without the SWR behavior happening. It's a 13.65 MHz spurious oscillation. Until I had mine modded I couldn't operate on 10 Meters with any antenna at all. So I looked at the rig with a spectrum analyzer and saw the spurious oscillation. Now who thinks that it's normal to have to add a bunch of external grounding in order to not have a spurious oscillation occur. Come on!

Yaesu sells the bare plugs, for the cable or radio end, for $4.30
each.
Best price i've seen for them. I got got them from the Ceritos office.

From: n9cv
Topic: 13095  Message: 13118

It is cheaper for Yeasu this way. They only have to fix the ones that are sent back under warrantee for free. If the PA quits after the warrantee period, then they get to charge you up to $500 to repair the radio. If they publicly admit there is a problem, then they would have to fix all radios in the field. They also would have to pay someone at Yeasu to find and to open all of the boxes that they have in stock or at the dealers and to fix all radios prior to sale. Some of these new radios FT-100Ds have serial numbers from 1999. I do not know what effect this policy has had on sales of their products, but it can not be good. I personally know of one sale that they lost because of this policy.

One heck of a way to run a business isn't it. There is an interesting thread going on right now on QRZ.com about other Yaesu products and frequency of return to Yeasu for warrantee repairs.

I think Yeasu intensionally takes their time fixing these so as to discourage the bulk of FT-100 owners from sending them in for repair. Most people do not want to wait fot 8 weeks plus to have a 1/2 hour repair done in California.

This is one time where the Non-North American hams probably have a better turn around time in their local country than us in Canada and the US.

Send it in, have the mods done, find another hobby for a couple of months, and you'll love the radio when it returns from it's California vacation. I love my unit now. I beat the pile up two days ago with the FT-100D mobile and got Duce Island (VP6DI). I also got a VP5 from my mobile today.

They will update the FT-100 and fix it right. They just take their time about doing it. I had to send mine in when it was new also. Luckily it lasted through my 4 weeks mobile through Central and Western Canada and failed two days after I returned. If it fails this year while I am in BC, Alberta and the Yukon, I will be plenty mad. It has run fine since being repaired in last August. I run it mobile every day whenever the ignition switch is on in my car. I am convinced the fixes work and you should see no more problems after it returns.

I do!

I have played with vertical antennas for years and always come back to the same conclusion: Take the time, care and good operating practice to ground a vertical properly with an effective ground/ground plane/radial system or you get all the problems you have mentioned. Plus, the antenna radiates like it was designed to do rather than like a wet noodle whose SWR changes as the coax length changes, not to mention that the rig doesn't need to visit Cerritos.

Sounds like another cure the symptom, not the cause. Can't emphasize enough the importance of proper bonding of all body parts!! Had the same problem on my car, and ending up with 2 braided bonds from the antenna mount to the trunk lid, along with 2 from the trunk lid to the car body. Hated to drill holes in my brand new car, but, priorities, you know....

ft100 software - new version

Ft100 version 0.0.7 has been released under the GPL (free for those who don't know) for both linux & (due to unpopular demand) windows.

Currently there is a gui for linux, but none for windows. The windows version is command line only. If there is anyone out there that is willing to write a simple gui front end for windows, please contact me off list.

There will be a new gui front end for linux released sometime in the next few days.

See http://www.qsl.net/kc2ivl/ for more details

Maybe I'll be one of the lucky ones and not have any problems. The main problem I have is that you shouldn't have to send the radio in at all to have it fixed and running properly right from the start. There is no amount of excuses they can offer that will replace good quality control. It's like Windows operating system; they release it with known bugs, then when people complain they fix it. That sucks.

I took the cover off mine this morning and looked at it. The ground to the chasis is not a braided material. It looks like a copper colored foil. If I had known about all of the folks sending their units back to the factory and then getting them back as fixed and are now happy, I would have bought some other radio. As yet I have no problems, but I've only had it for a couple of days, so who knows what will happen. I just know one thing and that is that you should NOT have to send the radio in to Yaesu to have a mod made that should not even be needed in the first place and that they could fix when they manufacture the radio since it's a known problem on some radios.

OK, I'm off the soap box and now will get to learning how to use it and figure out all the features, of which there are many.

73,

Dick

# 13126. Re: [FT100] Re: ATAS-100 won't tune on 10m ?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-27 16:03:16 UTC
From: John McClain
Topic: 13095  Message: 13126

Dick,
I feel the same as you and I would imagine that most of us on this list would agree. The foil that you saw is Yaesu's mod for the problem, they do not use the braid. If you should detect the SWR problem in the next few weeks, don't worry about sending the rig to Yaesu for repair, return it to the dealer for replacement as I did. I purchased mine in mid December of last year and found that mine was a dud right out of the box. It had a 0D serial number which means that it had been manuafactured almost two years earlier. The dealer exchanged it for another 100 that had a serial number beginning with 1G. This second rig had Yaesu's SWR mod and is working OK. However, it does not have the fan mod so I installed the resistor to keep the fans spinning. I will be returning it to Yaesu while it is still under warranty to have Yaesu's fan mod installed but I want to use it for several months before sending it in.

Maybe I'll be one of the lucky ones and not have any problems. The main problem I have is that you shouldn't have to send the radio in at all to have it fixed and running properly right from the start. There is no amount of excuses they can offer that will replace good quality control. It's like Windows operating system; they release it with known bugs, then when people complain they fix it. That sucks.

I took the cover off mine this morning and looked at it. The ground to the chasis is not a braided material. It looks like a copper colored foil. If I had known about all of the folks sending their units back to the factory and then getting them back as fixed and are now happy, I would have bought some other radio. As yet I have no problems, but I've only had it for a couple of days, so who knows what will happen. I just know one thing and that is that you should NOT have to send the radio in to Yaesu to have a mod made that should not even be needed in the first place and that they could fix when they manufacture the radio since it's a known problem on some radios.

OK, I'm off the soap box and now will get to learning how to use it and figure out all the features, of which there are many.

73,

Dick

They will update the FT-100 and fix it right. They just take their time about doing it. I had to send mine in when it was new also. Luckily it lasted through my 4 weeks mobile through Central and Western Canada and failed two days after I returned. If it fails this year while I am in BC, Alberta and the Yukon, I will be plenty mad. It has run fine since being repaired in last August. I run it mobile every day whenever the ignition switch is on in my car. I am convinced the fixes work and you should see no more problems after it
returns.

# 13127. Re: [FT100] Re: ATAS-100 won't tune on 10m ?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-27 16:36:10 UTC
From: Dick Thompson
Topic: 13095  Message: 13127

OK, John, thanks. I somehow was under the impression that the braid was what was used when the mod had to be made.

As for the fan, the fan in mine kicks in as soon as I key the mike, and sometimes will run a few seconds longer after I drop the carrier. Is that indicative of the fan mod? Also, the fans are not the quietest in the world (compared to my new FT-920), but it's not all that irritating.

I have a lot to learn about this rig. I have the 5 QMB slots programmed with 5 frequencies I use on 2 meters. I will be doing some preparation to install it in the mobile, today. I bought the Quick Release mobile bracket when I ordered the rig. I'm going to call Yaesu in Cerritos today to order a couple of power cord connectors. They are different than anything I've seen, but I like them. If you can think of anything else I should be aware of I'm open for all suggestions/comments. So far I love this little box of knobs and switches and I'm sure when I get it down to the point where I know what all of them do I'm gonna love it even more. I can hardly wait until I can run it mobile on HF and use it in my camper this summer. :)

73,

Dick

# 13129. FT-100D Spurious Oscillation Repair

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-27 17:57:33 UTC
From: backhoefade
Topic: 13095  Message: 13129

The copper adhesive tape is not the final mod that the repair center does to eliminate the spurious oscillation. That's the "mod" that the factory applied for a while, but often the problem will appear after the adhesive apparently loses some contact.

The proper, permanent, mod for the spurious oscillation is a solid metal strap which gets screwed into the horizontal rib and is also soldered in a couple spots. If you just have the copper tape "mod" it likely will only last a few months.

Second, you don't have the "VHF/UHF fan mod" unless the fans automatically turn on during long periods of receiving on VHF/UHF. The non-modded performance will see the fans only turning on when transmitting and for some number of seconds after completing a transmission.

There is an on-going, somewhat understandable, reluctance to admit that you have bought a new radio which actually in many cases requires two immediate "modifications" in order to function properly. I think part of the problem is "ego" since no one likes to admit they just shelled out $1000 for a rig they have to send to the repair center. Second, it's just a pain to let the rig go for the several weeks to get the mods done. In many instances you may be able to alleviate the spurious oscillation by using extensive external grounding but I will tell you from my personal experience that once the proper internal grounding is done I can run my FT-100D on 10 and 17 Meters on virtually any reasonably matched antenna in the house or in my car with absolutely no grounding other than the DC 12 Volt return line to the battery. I use a mag mount whip on 10 meters on the roof of my Honda with zero extra grounding with no hint of "SWR icon" spurious oscillation. I could never get away from the spurious oscillation (observed directly using a spectrum analyzer) until it was modded.

So, believe me, the rig has two flaws, but the "mods" (actually more appropriately called "final manufacturing steps") take care of both bugs very well. It's worth the trip to the repair center. You end up with the superior performer (relative to the 706) but you have to do the mods.

PS - to the guy who still thinks that the extra external grounding is mandatory for vertical antennas I say "of course it is!" but don't confuse that with the need to add grounding to eliminate a spurious oscillation that's due to an internal marginal design issue. A transmitter should never ever output high level spurious signals, regardless of presence or absence of extra external grounding. In

fact it shouldn't ever emit high level spurious signals no matter what arbitrary load you have it terminated in.

I bought the Quick Release mobile bracket when I ordered the rig. I'm going to call Yaesu in Cerritos today to order a couple of power cord connectors. They are different than anything I've seen, but I like them. If you can think of anything else I should be aware of I'm open for all suggestions/comments. So far I love this little box of knobs and switches and I'm sure when I get it down to the point where I know what all of them do I'm gonna love it even more. I can hardly wait until I can run it mobile on HF and use it in my camper this summer. :)

# 13130. Re: [FT100] Re: ATAS-100 won't tune on 10m ?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-27 17:56:02 UTC
From: John McClain
Topic: 13095  Message: 13130

Dick,
The 1L serial number indicates that yours was built in October
of 2001. Wow, that is the newest unit that I have seen mentioned
here on the list. You can tell if the fan mod is installed by
transmitting on HF long enough to heat it up, unkey and return to
receive where the fans will continue to spin because of the heat build
up. Now switch to VHF or UHF. If the fans stop while the unit is
still hot, you do not have the mod. You can also open up the rig and
compare it with the many pictures that can be found in either the
PICTURE area or BINARY area of this list at Yahoo.

OK, John, thanks. I somehow was under the impression that the braid
was what was used when the mod had to be made.

As for the fan, the fan in mine kicks in as soon as I key the mike,
and sometimes will run a few seconds longer after I drop the carrier.
Is that indicative of the fan mod? Also, the fans are not the
quietest in the world (compared to my new FT-920), but it's not all
that irritating.

I have a lot to learn about this rig. I have the 5 QMB slots
programmed with 5 frequencies I use on 2 meters. I will be doing some
preparation to install it in the mobile, today. I bought the Quick
Release mobile bracket when I ordered the rig. I'm going to call
Yaesu in Cerritos today to order a couple of power cord connectors.
They are different than anything I've seen, but I like them. If you
can think of anything else I should be aware of I'm open for all
suggestions/comments. So far I love this little box of knobs and
switches and I'm sure when I get it down to the point where I know
what all of them do I'm gonna love it even more. I can hardly wait
until I can run it mobile on HF and use it in my camper this summer.
:)

Subject: Re: [FT100] Re: ATAS-100 won't tune on 10m ?

Dick,
I feel the same as you and I would imagine that most of us
on
this list would agree. The foil that you saw is Yaesu's mod for the
problem, they do not use the braid. If you should detect the SWR
problem in the next few weeks, don't worry about sending the rig to
Yaesu for repair, return it to the dealer for replacement as I did.
I
purchased mine in mid December of last year and found that mine was
a
dud right out of the box. It had a 0D serial number which means
that
it had been manuafactured almost two years earlier. The dealer
exchanged it for another 100 that had a serial number beginning with
1G. This second rig had Yaesu's SWR mod and is working OK.
However,
it does not have the fan mod so I installed the resistor to keep the
fans spinning. I will be returning it to Yaesu while it is still
under warranty to have Yaesu's fan mod installed but I want to use
it
for several months before sending it in.

Subject: Re: [FT100] Re: ATAS-100 won't tune on 10m ?

Maybe I'll be one of the lucky ones and not have any problems. The
main problem I have is that you shouldn't have to send the radio in
at
all to have it fixed and running properly right from the start.
There
is no amount of excuses they can offer that will replace good
quality
control. It's like Windows operating system; they release it with
known bugs, then when people complain they fix it. That sucks.

I took the cover off mine this morning and looked at it. The ground
to the chasis is not a braided material. It looks like a copper
colored foil. If I had known about all of the folks sending their
units back to the factory and then getting them back as fixed and
are
now happy, I would have bought some other radio. As yet I have no
problems, but I've only had it for a couple of days, so who knows

what
will happen. I just know one thing and that is that you should NOT
have to send the radio in to Yaesu to have a mod made that should
not
even be needed in the first place and that they could fix when they
manufacture the radio since it's a known problem on some radios.

OK, I'm off the soap box and now will get to learning how to use it
and figure out all the features, of which there are many.

73,

Dick

They will update the FT-100 and fix it right. They just take
their
time about doing it. I had to send mine in when it was new also.
Luckily it lasted through my 4 weeks mobile through Central and
Western Canada and failed two days after I returned. If it fails
this year while I am in BC, Alberta and the Yukon, I will be
plenty
mad. It has run fine since being repaired in last August. I run
it
mobile every day whenever the ignition switch is on in my car. I
am
convinced the fixes work and you should see no more problems after
it
returns.

# 13131. We are not alone

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-27 18:56:16 UTC
From: backhoefade
Topic: 8946  Message: 13131

I don't know if this will provide any solace for those of us who suffered through the pain of the "SWR icon" bug in our FT-100Ds and are perhaps kicking ourselves for not buying the other rig. Read what I just found at the "other rig's" bulletin board!

---

I have the 706 MkII and have had similar problems - on 15 and 17 meters. It appears to be a high VSWR and an output without speaking into the mike or sending any characters on CW. If you hook up a dummy load things APPEAR OK, but they really are not... What I had was spurious output - around 45 watts on 23 MHz. (A dummy load doesn't care of course what the frequency is - but your antenna obviously isn't resonant there - hence the high VSWR). I chased a phantom antenna problem for quite awhile before realizing what was going on!

The solution I found was the same as Dave, G3VFP suggested. Remove the covers and tighten every screw you can see that hold the circuit boards and transistors in place. I actually loosened every one slightly and then tightened them down. I also made sure that the finger stock that touches the covers was clean and making good contact. Finally, when you put the covers back on, check every screw twice - sometimes tightening one will relax the tension on others.

---

Maybe we should follow the 706 owner's lead and tighten every screw you can access on the PC boards. (I know someone already suggested this for the FT-100D).

I'll bet a few of us suddenly feel a whole lot better. Although it seems to be much more rare on the 706 - it does happen with that design too, sometimes.

Common problem in the TS-120S. Cured most of the time by tightening the mounting screws on the RF board.

Topic: 8946  Message: 13133

I know you previously posted some good discussion about semi-conductors. I was curious if you could shed some light on the possible mechanism here. Is this a matter of the final amp devices losing their solid ground and in some fashion this pushes them into an unstable region, via one or more of the S parameters getting shoved outside the stability circle?

Ah! The problem is not new. I had a TS 130S and it oscillated on 40 meters when I tried it out on a mobile whip (Hustler). Contacted dealer and was advise to loosen and re-tighten the screws on the rf board etc. Behold. It worked! As I said the problem is not new. That was in 1981! Perhaps the problem is caused by oxidation on the aluminum alloy after some time in use. Just a thought.

Subject: [FT100] We are not alone

I don't know if this will provide any solace for those of us who
suffered through the pain of the "SWR icon" bug in our FT-100Ds
and are perhaps kicking ourselves for not buying the other rig.
Read what I just found at the "other rig's" bulletin board!

---

I have the 706 MkII and have had similar problems - on 15 and 17
meters. It appears to be a high VSWR and an output without speaking
into
the mike or sending any characters on CW. If you hook up a dummy load
things APPEAR OK, but they really are not... What I had was spurious
output - around 45 watts on 23 MHz. (A dummy load doesn't care of
course
what the frequency is - but your antenna obviously isn't resonant
there -
hence the high VSWR). I chased a phantom antenna problem for quite
awhile
before realizing what was going on!

The solution I found was the same as Dave, G3VFP suggested. Remove
the
covers and tighten every screw you can see that hold the circuit
boards and
transistors in place. I actually loosened every one slightly and then
tightened them down. I also made sure that the finger stock that
touches
the covers was clean and making good contact. Finally, when you put
the
covers back on, check every screw twice - sometimes tightening one
will
relax the tension on others.

---

Maybe we should follow the 706 owner's lead and tighten every screw you can access on the PC boards. (I know someone already suggested this for the FT-100D).

I'll bet a few of us suddenly feel a whole lot better. Although it seems to be much more rare on the 706 - it does happen with that design too, sometimes.

Common problem in the TS-120S. Cured most of the time by tightening the
mounting screws on the RF board.

# 13138. Re: [FT100] Re: We are not alone

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-27 20:17:03 UTC
From: Dr. Gerald N. Johnson, electrical engine
Topic: 8946  Message: 13138

There is a lot of gain in a small space. Stability depends on grounding the board to the frame in lots of places. Loosing a ground lets there be a stray ground current couple from output to input and there's oscilation at some frequency not determined by the drive. When that's above the cutoff frequency of the low pass filter (switched for practically each band) the oscillation passing through the PA sees a bad mismatch and that causes the collector voltage or current to rise excessivly and that destroys the transistor. It may be several stages in the gain loop of the spurious oscillator, it may be just the PA or the driver. Its most likely several stages because the gain is higher and since each stage inverts after two stages the output is in phase with the input for more effective oscillation. The phase angle of the feedback probably also depends on the effective impedance and phase angle of that impedance of the output low pass filter. If the harmonic filters terminated the harmonics in 50 ohms instead of a short (or open) the PA might not be destroyed by the parasitic oscillation. Might not even oscillate. But a complimentary filter like that would double the size of the low pass filter section of the radio.

Bill Sabine wrote an interesting article about that type of filter in QEX a year or so ago. Noticed that solid state PAs were more linear with the harmonics terminated in a 50 ohm load rather than a reactance. Makes sense, since the PA creates harmonics and if those aren't loaded they (whether current or voltage according to the termination reactance at the harmonics) modify the output voltage and current of the device and since its not linear they mix with the fundamental and modify it.

From: Dr. Gerald N. Johnson, electrical engine
Topic: 8946  Message: 13139

I've fixed several TS-120 by tightening the screws or telling the owner the tighten the RF board mounting screws. Lots of gain in a small space and the complete grounds of the board are dependent on their mounting. Its a common problem. I've also fixed several VHF FM radios remotely with the same suggestion.

I think its a combination of vibration loosening the screws and the insulating material of the board relaxing under pressure (the definition of "plastic"). I didn't get into mounting printed circuit boards at Collins, but before that era it was a standard rule that one never made a connection dependent on compressing an insulator. E.g. if we mounted a Jones barrier strip with the four screws, we couldn't use one of those (and that Bakelite is a lot harder than PC board material) to ground the cable shield. We had to use a separate screw directly to the chassis. I suppose Collins would have soldered a braid strap adjacent to each board mounting screw and then with a crimp lug solidly crimped to the braid have used a second screw to ground the braid. A superior technique would involve connecting ALL the board grounds to a grounded layer in the multilayer board so to make the grounding of the board critical only at its inputs and outputs and to use coax with a really good braid termination for all of those.

>
> Suggestions? Better grounding of the mount?
>
> Bill
> W1PA

This goes back to message 12453. I finally picked up a small Comet hatch lip mount, and moved the ATAS off the grounded luggage rack mount on my Subaru Legacy wagon (see my image in the installation folders and the reply included below)-- low-and-behold, 40 now tunes. Verified right up to 6m that the rest of the bands tune as well.

Not sure what is going on. I had a wide ground strap directly from the SO-239 base on the K550 luggage mount to a screw on the luggage rack, verified that the luggage rack is grounded to the car chasis, but to no avail. Might be some interaction between the luggage rack and the chassis (big capacitor effect?) --- don't know.

Looks like the ATAS wants to be as close to the flat sheet of metal as possible. I'm not completely confident with the smaller Comet mount (I can't use the full size lip mount because there isn't enough metal above the hatch window before the line of the door curves to the top, and the top edge is out because the it drops down when the hatch is lifted). We'll see. I take my ATAS on and off a lot, so I can at least be aware of when it might start to loosen.

Avoid those luggage racks.

Bill
W1PA

Original reply:

I was helping another ham install his FT100D and ATAS on a Dodge truck last weekend, and finally had the time to put an analyzer on my ATAS, which has never loaded on 40m. I manually ran the ATAS all the way out, disconnected the pigtail, and put the analyzer on it. It was resonant at 6.80 Mhz (so it's not a whip length issue), but with an impedance above 50 ohm, almost 150 for a SWR of close to 3:1.

We tried his ATAS with the same result. I have mine installed on my luggage rack with a K550 mount and a ground strap to the rack, and I

have confirmed that the rack is grounded to the chassis.

See: http://groups.yahoo.com/group/FT100/files/Mobile%
20Installations/W1PA/K550_closeup.JPG

His is installed on his hood, with a K400 clipped to the edge. His loads on 40m, not great, but it does.

Any antenna gurus think, based on these results and the impedence numbers, that I might be better off with a K400 mounted on my hatch door lip of the Subaru wagon versus the rack? My ATAS works and loads very well on _all_ other bands other than 40m... including WARC.

Dick: Here is my solution to the special connectors used on transceivers. I use the plug set that comes with the rigs and then I use Radio Shack Heavy Duty connectors 274-151 and 274-154 20 amp connectors at $0.99 each. They are availabe at any Radio Shack all over the place and don't cost an arm and a leg. I use these connectors as standard for all my high current 12V rigs.

I just got mine on Monday evening.. There are a bunch of comments on this reflector that talk about a couple of modifications. Some have had to have them done, others haven't. Even though I've only had mine for a couple of days, I think I could safely say that I'd buy it over the 706 MKII. It is a nice radio and I've owned a lot of Yaesu equipment over the past 40 years of being a ham. So, to answer your question, yes, I'd buy another one despite the minor flaws it may ot may not have.

From what all you guys have told us (thanks!), the FT-100D needs an SWR mod and a fan mod. So how do we protect ourselves when we buy a new one now? Demand that the dealer get this done before we plunk down a thousand bucks? Buy it direct from Yaesu (is that possible?) and demand that the mods be made first? Or buy it anyway and hope a lot, or what?

Thanks !!

Well, I called Yaesu in Ceritos this afternoon. The male plug was $4.25 and the female was $2.52. Shipping was $4.00. He said he'd try to get them out today. He couldn't supply me with a part number for the fuse holder and said they may no be available as a part that someone can order. I told him if he found out they "can" be ordered to go ahead and add them to my card and order and ship them. Won't know unless he e-mails ne or I get them..

From: larry cook
Topic: 13148  Message: 13148

Brother Hams,

I am new to the group and the hair is beginning to stand up on the back of my neck. I've had my FT100D for around 11 months. It is mostly used mobil in my Ford Explorer on 2m/70cm. I have used it on HF while traveling with no problems. HOWEVER, just lately I purchased a new laptop with the intent of doing some PSK31 and RTTY. When I brought the rig into the shack and hooked it up to my MFJ Deluxe Versa Turner II, I discovered I can NOT get it to tune on any HF band using a G5RV antenna. Operates just fine on VHF. The shack is well grounded as well as the radio, tuner and power supply.

This grounding problem you are discussing, Sense I missed the original thread, could someone bring me up the speed.

Many thanks

Larry/N4JMX

Even though you said that it worked fine mobile on HF I would guess that you didn't try it on 24 or 28 MHz HF. The fact that it won't tune on any HF band with that combination of tuner and G5RV tells me that it's highly likely that you need the "SWR mod". I use my modded FT-100D on all HF bands with a G5RV and an MFJ tuner without a hint of trouble! If you have access to a spectrum analyzer or a receiver that can tune around 13.65 MHz you can check for the spurious oscillation that results in the SWR icon popping up when you wouldn't expect it. If you see it (or hear it) then you need the mod. The other possibility in your case is that you've just got something fundamentally wrong with your feedline, etc., but I'm sure you already checked all that out. Once you mod the rig it will run just super on any band.
N6AF Chas

# 13151. First impresssions

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-28 02:43:50 UTC
From: Ron Murdock
Topic: 13151  Message: 13151

Greetings from Yuba City.
Thought someone might benefit from my brief experience with the FT-100D and ATAS-100.
I purchased the separation kit, the radio, and the antenna and they all work as advertised.
I also got the remote mounting bracket for the control head, but couldn't find a way to use it.
My car is a 2002 Chrysler Town and Country. I can move the front console to the rear passenger
area but didn't need to. I mounted the radio in the alternate console mounting area. This is a
good compromise in my situation to having the body of the radio within reach (don't need it within reach)
or having it completely out of sight in the cargo area.
I have two antennas, the ATAS and a mag mount dual bander Uhf/Vhf. No single antenna operation is
planned but I checked the operation on the ATAS on 2m and 440 and it worked just fine.
My ATAS is mounted on a 12"by 28" 1/8" thick piece of stainless steel. The roof rack allows me to quickly remove
the entire antenna, the entire mount, or leave it in place. I grounded both sides of the steel plate to rack screws holding
the rack to the roof. Each ground is a simple push on-pull off power pole connector.
This radio was produced in July, 2001, according to the serial number.
The control head mounting took the most time, aside from finding stainless steel for the roof mount. I finally put the control head mounting attachment at the top of the air outlet assembly in front of the center console. This is just above the level of the dash and will be invisible from outside the car. I chose to put in a dash mat and matching fabric piece to cover the control head, keep it out of the direct sunlight, as well as out of sight. This method has worked in another van using the IC-706 and a screwdriver antenna for the past 7 years.
Grounding the radio was simple. The mid seat position for the movable console is covered by a fitted rubber mat. Under the mat is a connector for the power connections for the console and chassis mounting screws. I lifted one just enough to put the ground luck under it, and tightened it back down. Of course the mobile mounting bracket is grounded to this point and thus the radio.
Several hour long trips have shown the value of the dsp features. I've had contacts on 10, 15, 20, and 40 meters. Lots of repeater work on 2m and 440 to as well as simplex. While I usually call people I can hear, several people have been able to hear me that I would not have called due to initial signal strength. The dsp allows enough latitude in tuning to get these signals in clearly.
I am completely happy with the radio/antenna combination.

Topic: 13152  Message: 13152

Hey guys, just picked up a FT-100 (serial prefix 8G) and a

ATAS-100 antenna. Everything seems to work OK except I can't

get the antenna to manually tune VIA the UP/DOWN buttons on

the MIC. (MH-36b mic) I have MENU # 61 set atas-1 and read

the owners manual on the subject but no luck.

Thanx for any info .....ART KE6MIV

Thanks for the information, Ron. It's good to know that there are those out there that haven't had any problems. I hope I'm as lucky as you. So far I've really had fun with the 100D. But eventually it will go into my pickup truck and I hope to add the ATAS antenna in a few months. Until then I'll use the Hamsticks that served me so well until I added a Hustler 4BTV Vertical.

Subject: [FT100] First impresssions

Greetings from Yuba City.
Thought someone might benefit from my brief experience with the FT-100D and ATAS-100.
I purchased the separation kit, the radio, and the antenna and they all work as advertised.
I also got the remote mounting bracket for the control head, but couldn't find a way to use it.
My car is a 2002 Chrysler Town and Country. I can move the front console to the rear passenger
area but didn't need to. I mounted the radio in the alternate console mounting area. This is a
good compromise in my situation to having the body of the radio within reach (don't need it within reach)
or having it completely out of sight in the cargo area.
I have two antennas, the ATAS and a mag mount dual bander Uhf/Vhf. No single antenna operation is
planned but I checked the operation on the ATAS on 2m and 440 and it worked just fine.
My ATAS is mounted on a 12"by 28" 1/8" thick piece of stainless steel. The roof rack allows me to quickly remove
the entire antenna, the entire mount, or leave it in place. I grounded both sides of the steel plate to rack screws holding
the rack to the roof. Each ground is a simple push on-pull off power pole connector.
This radio was produced in July, 2001, according to the serial number.
The control head mounting took the most time, aside from finding stainless steel for the roof mount. I finally put the control head mounting attachment at the top of the air outlet assembly in front of the center console. This is just above the level of the dash and will be invisible from outside the car. I chose to put in a dash mat and matching fabric piece to cover the control head, keep it out of the direct sunlight, as well as out of sight. This method has worked in another van using the IC-706 and a screwdriver antenna for the past 7 years.
Grounding the radio was simple. The mid seat position for the movable console is covered by

a fitted rubber mat. Under the mat is a connector for the power connections for the console and chassis mounting screws. I lifted one just enough to put the ground luck under it, and tightened it back down. Of course the mobile mounting bracket is grounded to this point and thus the radio.
Several hour long trips have shown the value of the dsp features. I've had contacts on 10, 15, 20, and 40 meters. Lots of repeater work on 2m and 440 to as well as simplex. While I usually call people I can hear, several people have been able to hear me that I would not have called due to initial signal strength. The dsp allows enough latitude in tuning to get these signals in clearly.
I am completely happy with the radio/antenna combination.

# 13154. Grounding,Grounding,Grounding

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-28 05:15:15 UTC
From: The Scholtz's
Topic: 13154  Message: 13154

I posted on this subject before, I mentioned that it didn't make much sense to do the "SWR Mod." to me, because all you are doing is grounding that circuit to the same metal case it is already mounted to!
I had found all of the screws loose inside my radio, EVERY one, from the board mounts to the final heat sink mounts. As an electronics repair person, I KNOW this is a serious problem waiting to happen. I posted my findings and observations, I got flamed by the professor, who I guess disassembles EVERY thing he buys to check for design flaws before the first power up. And he was cheered on by the former AOL chatroom flaming expert. (I would have included a quote from that post, but his typed E-mail is copyrighted I guess).
Never the less, the SWR Mod is a simple mod, and I did it anyway. (sometimes putting on the Band-Aid first will prevent the cut!) I don't plan on using this rig for VHF/UHF, but I did the fan mod as well, it is also very easy. I spent 30 minutes, and about 35 cents doing these mods. They certainly dont hurt anything and not a big deal even if I don't think it is a solution. I think it is at best a "band aid" for a different problem.
To those who are being scared off of the FT100D, let me say this, it is a fantastic radio, the 706 is a transistor radio compared to the FT100D. I have it in a 2000 Silverado, the ATAS 100 is mounted on a simple "L" bracket to one box side. VERY WELL GROUNDED! and I am in AWE of what this setup does. I have NO problem working DX mobile, I busted the VP6DI pileup on 15, XR0X on 10 & 20, and have made dozens of contacts throughout Europe and Asia. It seems as easy as doing it with my IC746 and 4 element beam at home! There is even less noise on the mobile rig than on my base rig at home!
I think a lot of the problems here are caused by user error, as well as the loose screws left by the factory.
But look at some of these posts! ground straps here, ground straps there.... how long did these units get used before these users found out they had poor installs! secondly, I saw a post where a man couldn't figure out why the FT100D shut off when he disconnected the coax from his antenna! And if you have been reading these posts for awhile, you should notice that most of the problems discussed here are from the same dozen or so owners. AND, how many dumb questions have you seen posted about simple functions, APO, VOX break-in and Full break-in, can't manually input frequency from the DTMF pad, Duty cycles, the "little circle with the swr icon"..... the list is LONG. All because they hook up the radio and start QSOing and don't read the manual, I don't mean this as an attack on anyone, but these same people will be posting about their "Failures" in the near future. I have no doubt that there are some very smart people that contribute to this forum, but most of these geniuses aren't smart enough to CUT AND PASTE portions of the messages they respond to, giving all of us the opportunity to re-read every post six or seven times a day. I love my FT100d and ATAS100, if you are still on the fence about buying one, jump off and go for it... buy it, install it, use it, love it!
I'm sure this post will get the neighborhood chat room dropout Flamers going. So I will stay in this group to read the witty responses a few more days before I unsubscribe!

Thanks to all that gave honest opinions, with out the flame jobs, when the questions were asked and observations were made. good luck to all you future FT100D owners! you wont be sorry you bought this radio.

Topic: 13136  Message: 13155

Frank, I don't think the mods that are mentioned are a big deal. I kind of feel that the number of rigs that have had to be sent to Yaesu for the mods is in the minority, compared to the number of these little rigs being sold.

If you can get a dealer to send one in and have the mods done, more power to you. I think you may have a problem getting one to do that. Same-o same-o on Yaesu. Plus, I don't think you can buy direct from Yaesu.

But the radio and enjoy it. So far mine has been flawless. I'll cross the bridge with the problems if and when I happen to get to it.

73,

Dick

>From what all you guys have told us (thanks!), the FT-100D needs an SWR mod
and a fan mod. So how do we protect ourselves when we buy a new one now?
Demand that the dealer get this done before we plunk down a thousand bucks?
Buy it direct from Yaesu (is that possible?) and demand that the mods be made
first? Or buy it anyway and hope a lot, or what?

Thanks !!

Interesting comments, Jeff.

I've come to the conclusion that there isn't one single perfect radio. I agree with everything you said and as soon as I get a chance I'm going to check the screws.

One question: Where did you find the info to do the mods? They both sound so simple I'm beginning to wonder if all they are doing is madding a fan and changing a ground, why send it in?

For anybody with questions,

At the bottom of each and every email you have ever and will ever receive from this reflector there is a link

It is http://www.k0lee.com/ft100faq.html

Click on it and you'll find the answer to every question that has been asked here in the last year or two. It's obvious, by the number of rehashed questions here in recent times, that people have not read the information available.

Read it all and then if there are any new questions, by all means put them forward.

73 and happy ft100ing,
Alek. VK6APK

# 13167. Re: [FT100] ATAS-100 won't tune on 10m ?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-28 07:45:15 UTC
From: John Spiceman
Topic: 13095  Message: 13167

I think we are talking about two things here.
1) the actual SWR problem that a trip to Cerritos
cures
This can be tested by the open mic routine as has been
suggested.

2) An antenna feedline/ground/groundplane inbalance

As far as the feedline not making any difference, I
always thought that was only true with open wire
balanced feedline. You can use a 1/4 mile of that
stuff with no ill effects because it has the effect of
putting the transmitter right at the antenna.
The only way an unbalanced line like coax will react
the same is if it is cut in exact wavelength multiples
of the frequency you are transmitting on, and that
involves using velocity factors et al for the
particular coax. Who wants to stay on the same
frequency all the time anyway. So unless you do, the
cut coax length will always have something to do with
the SWR.

As for the ground system, I have just installed a
ground mounted vertical for the first time in my ham
experience. It said in the directions to not be fooled
by mere low SWR readings with no or only a few ground
radials. It just won't radiate RF but instead be
absorbed into the ground. The more metal surface area
under that vertical element, the better. I.E. why you
want to have all the car metal hooked together to
provide the largest metal area you can.

After reading Scott's original post again, is it
possible that 10 mtrs was the second band he tried out
of the box and the one the ATAS left Yaesu tuned to
was the first he tried. Ya sure that ATAS2 was
activated in the MENUs before the TUNE button was
pushed? Just a thought ...

From: The Simpsons
Topic: 13136  Message: 13168

Yes, definitely.
I have had no problems with mine, in 50,000km (about 30,000 miles) in two 4 wheel drive vehicles. I have done the SWR mod and added the resistor to the fans for the VHF/UHF heating problem. My FT100 ran cool on receive on VHF/UHF anyway, but the extra cooling won't do any harm. I use mine on all HF and VHF/UHF bands. The only band I haven't had a contact on is 160 metres. I only use the radio while mobile.

Grant, ZL2BK.

I guess that I should have been more specific in the announcement, it is control software. There is a gui front end and command line version for linux, and a command line only version for windows.

If I had the money I'd purchase one or two more.

Did the two mods myself, no problems.

It is a beautiful rig. I love it. Even better now that I've got the ATAS-100 antenna as well.

# 13171. Stupid VHF/UHF antenna question

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-28 14:53:51 UTC
From: w1pa
Topic: 13171  Message: 13171

Is there a "rule-of-thumb" for which antennas need a ground plane and which do not (i.e. can be used on a mag mount or a non-grounded luggage mount)?

As I skim the HRO catalog, is it anything with an odd multiple of a 1/4 wave needs the plane, and the even 1/4 wave multiples (i.e. 1/2) as well as 5/8 and 7/8 don't?

HRO puts some notes on the Diamond list, but not on the Comet.
Looking for a good dual-band match for my 100D on the luggage rack.

Bill

HEAR!! HEAR!! I totally agree with what you're saying!
I was just thinking the same as I was reading the posts this
morning. Bottom line - RTFM - before the questions are
asked. Good grounding is a MUST in ANY installation,
especially mobiles.

Dave WP2AAT

The Scholtz's wrote:
>
> I posted on this subject before, I mentioned that it didn't make much sense to do the "SWR Mod." to me, because all you are doing is grounding that circuit to the same metal case it is already mounted to!
> I had found all of the screws loose inside my radio, EVERY one, from the board mounts to the final heat sink mounts. As an electronics repair person, I KNOW this is a serious problem waiting to happen. I posted my findings and observations, I got flamed by the professor, who I guess disassembles EVERY thing he buys to check for design flaws before the first power up. And he was cheered on by the former AOL chatroom flaming expert. (I would have included a quote from that post, but his typed E-mail is copyrighted I guess). Never the less, the SWR Mod is a simple mod, and I did it anyway. (sometimes putting on the Band-Aid first will prevent the cut!) I don't plan on using this rig for VHF/UHF, but I did the fan mod as well, it is also very easy. I spent 30 minutes, and about 35 cents doing these mods. They certainly dont hurt anything and not a big deal even if I don't think it is a solution. I think it is at best a "band aid" for a different problem.
> To those who are being scared off of the FT100D, let me say this, it is a fantastic radio, the 706 is a transistor radio compared to the FT100D. I have it in a 2000 Silverado, the ATAS 100 is mounted on a simple "L" bracket to one box side. VERY WELL GROUNDED! and I am in AWE of what this setup does. I have NO problem working DX mobile, I busted the VP6DI pileup on 15, XR0X on 10 & 20, and have made dozens of contacts throughout Europe and Asia. It seems as easy as doing it with my IC746 and 4 element beam at home! There is even less noise on the mobile rig than on my base rig at home!
> I think a lot of the problems here are caused by user error, as well as the loose screws left by the factory.
> But look at some of these posts! ground straps here, ground straps there.... how long did these units get used before these users found out they had poor installs! secondly, I saw a post where a man couldn't figure out why the FT100D shut off when he disconnected the coax from his antenna! And if you have been reading these posts for awhile, you should notice that most of the problems discussed here are from the same dozen or so owners. AND, how many dumb questions have you seen posted about simple functions, APO, VOX break-in and Full break-in, can't manually input frequency from the DTMF pad, Duty cycles, the "little circle with the swr icon"..... the list is LONG. All because they hook up the radio and start QSOing and don't read the manual, I don't mean this as an attack on anyone, but these same people will be posting about their "Failures" in the near future. I have no doubt that there are some very smart people that contribute to this forum, but most of these ! geniuses

> aren't smart enough to CUT AND PASTE portions of the messages they respond to, giving all of us the opportunity to re-read every post six or seven times a day. I love my FT100d and ATAS100, if you are still on the fence about buying one, jump off and go for it... buy it, install it, use it, love it!
> I'm sure this post will get the neighborhood chat room dropout Flamers going. So I will stay in this group to read the witty responses a few more days before I unsubscribe!
>

Bill, the mag mount will hold the antenna in place, but you are not going to get the ground that you need, plus the other downsize to that is that you risk damage to the paint on your vehicle.

The best installation is to mount it right smack dab in the middle of the roof. I considered that, but I also considered the cost of divorce court if I drilled a hole in the top of our Buick. :) Plus, it would probably always be hitting tree limbs, since most citied are so inconsiderate and don't trim the trees high enough to keep us hams from breaking off antennas at the base. Hi Hi.

Any vertical type antenna is going to work better with some kind of metal under it. For about 4 months I used Hamstick mobile antennas and mounted a bracket at the top of one of the support posts for an aluminum cover over my redwood deck. Well, I guess I got lucky, as that aluminum cover acted as a huge car roof and the Hamsticks performed marvelously. Until I can afford to buy the ATAS-100 antenna I'm going to use the Hamsticks on my truck and then on my travel trailer when I can't toss a dipole in the trees.

If you're interested in seeing a photo of how I mounted the Hamstick bracket to the support post, let me know and I'll e-mail a picture to you. Just use a more direct address, as I'm not sure, but I think Yahoo Groups remove attachments.

# 13175. Re: [FT100] ATAS-100 won't tune on 10m ?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-28 16:17:00 UTC
From: Dr. Gerald N. Johnson, electrical engine
Topic: 13095  Message: 13175

The losses of open wire balanced feed line are low, if you neglect radiation. Radiation can be significant at VHF and the losses are not so low that a 1/4 mile works as if the transmitter was at the antenna, but with care such a long line has been reported to allow using an antenna on a hill and thus getting out better than from the creek bottom.

The other effect of open wire line is its characteristic impedance and impedance transformations. An open wire line impedance of 300 to 600 ohms is typical. When a quarter wave long that transforms a 70 ohm balanced dipole load to 1285 to 5,000 ohms which generally fits the classic tuner ranges. When the antenna Z is 1000 ohms (full wave center fed) this type of line presents an impedance of 90 to 360 ohms to the tuner. Very tuneable. With 50 ohm coax these same loads present 35 or 2.5 ohms to the tuner. 35 is a nice load, 2.5 is beyond the range of many tuners and can require a very large output capacitor. The high SWR on the coax will make its losses larger also.

# 13176. Re: [FT100] Stupid VHF/UHF antenna question

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-28 16:17:08 UTC
From: Dr. Gerald N. Johnson, electrical engine
Topic: 13171  Message: 13176

The verticals with odd 1/4 wave lengths demand good grounds to carry the large ground currents characteristic of their relatively low input impedance. Vertical any multiple of 1/2 wave length long have high impedance and thus low ground currents which lets them be less dependent on grounding. 5/8 and 7/8 are somewhere in between, sometimes a 7/8 is a 5/8 over a quarter wave making the feed impedance low. The 5/8 radiator is loaded to 3/4 wave so the feed z is low like a 1/4 wave. So it has considerable ground current. And needs a decent ground plane.

Antennas needing a ground plane tend to need something more flat than a luggage rack though that has to be better than a fiberglass roof.

# 13179. Substitute thermal switch for the fans

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-28 17:50:10 UTC
From: John McClain
Topic: 13179  Message: 13179

For those of you that like to experiment, a friend has located another thermal switch that you might be able to use as a substitute for the switch that Yaesu uses in their V/U fans mod. I have no idea what it looks like or whether it has normally open or closed contacts or even what temperature it switches at. It is used in the Alinco DR-6107 for the same purpose and he knows that it works because the other night his 50 watts dropped down to about 100mw when the finals got too warm. Its component id is TS001 and its parts number is 0HD5S-95B.

Hi Dick!
You wrote:
One question: Where did you find the info to do the mods? They both sound so simple I'm beginning to wonder if all they are doing is madding a fan and changing a ground, why send it in?

73,

Dick
wb0dul
Thre answer to the mods location is they are on this group in the main screen. someone more versed will surely give you the exact directions to those pictures!

Second, the slash Ø is easy! just hold down the "ALT" key then, using the number keypad, type "0216" when you release the alt key the slashed Ø will appear! (works with most fonts and software as well!)
Good luck with your FT100! I absolutly love mine!
I think the ATAS100 is worth EVERY penny it costs.

Thanks Jerry.

I have the Comet CA-2x4SR on the Subaru now opposite the ATAS, but at 36" it just hits the top of most parking garages (yes, I know, the ATAS is much longer, but I would rather worry about just one antenna than having to lower both).

The CA is on a K550 luggage rack mount and is 1/2 wave on 2m, 2x1/2 on 440. Works well and a good match based on the FT100D SWR meter.

I made the mistake of picking up a shorter SBB-2 to replace it, which is 1/4 on 2m, and 5/8 on 440. The FT100D doesn't like this antenna on the luggage rack on 2m (2.5:1). 440 is fine.

The SBB-5 is too long (38"), but the B-20 is only 30", 1/2 wave on 2m and 2x5/8 on 440. 6" shorter (enough to clear the ceiling) and shouldn't need a major ground plan. Off to HRO to swap it out...

I'm a firm believer in the flat ground plane despite the big black luggage rack on my wagon, especially after getting 40m back by moving the ATAS off the luggage rack and on to the hatch lip (see yesterday's post).

Thanks again,

Bill
W1PA

DX Off-topic: Has anyone actually worked 9K2ZZ on 10m when he calls CQ? I have never heard anyone spend so much time on the band and sound like he is enjoying it less... jees.

Perfectly safe for receive only. Ideal chance to learn how the radio works
while you wait for the larger power supply.

Grant, ZL2BK.

The rig draws about 1.6 amps max on receive; about 1.2 amps when squelched.

I've transmitted low power using a 5 amp power supply but I don't recommend it. You may starve it. Someone posted current versus output power a while ago but I think it was for HF CW output so that doesn't apply to you.

You can spend hours fiddling with that receiver. It's excellent.

# 13186. The dreaded "treadmill" effect

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-28 21:17:19 UTC
From: backhoefade
Topic: 13186  Message: 13186

I settled in for some relaxing CW on 40 meters last night. Thought I'd give the FT-100D / SB-220 combo a try. We're in a new QTH so we're a little cautious about using the "get to know your neighbors" amplifier. I started loading things up and suddenly the lights dimmed, I thought I heard something bang against the outside wall of the house and then it sounded like someone fired up a gigantic vacuum cleaner right outside the shack window. It was very loud. Was this the neighbor who we thought might own a carpet cleaning business, using his tools to revengefully "EMI" my receiver?
After a few seconds it shut down. I "calmly" peaked through the window blinds and didn't see a thing. So I quietly walked through the house to ask my wife if she'd heard or seen anything. She had the most confused sort of "what the heck was that?!" look on her face. The next moment found us both peaking through the kitchen blinds but we couldn't see a thing out front - it was dark, 10 PM.
So back once again at my station I hit the Iambic paddle and WHAM! there was that shrieking vacuum cleaner noise again. This time I looked across our "Ham / Rec" room and saw the XYL's treadmill whirling away. Sounds like a giant vacuum cleaner. We joked about all the other treadmills and various appliances turning on in our new neighborhood. Doubtful that; but what a bizarre experience. A healthy kW and a good dose of "TVI paranoia" can sure make for an interesting evening.

By the way, the FT-100D / SB-220 combo worked out great, once the interface matching network was installed - and the treadmill was unplugged. I won't even speculate about what it might be doing to our swimming pool equipment.

Hi Dick!
You wrote:
One question: Where did you find the info to do the mods? They both sound so simple I'm beginning to wonder if all they are doing is madding a fan and changing a ground, why send it in?

73,

Dick
wb0dul
Thre answer to the mods location is they are on this group in the main screen. someone more versed will surely give you the exact directions to those pictures!

Second, the slash Ø is easy! just hold down the "ALT" key then, using the number keypad, type "0216" when you release the alt key the slashed Ø will appear! (works with most fonts and software as well!)
Good luck with your FT100! I absolutly love mine!
I think the ATAS100 is worth EVERY penny it costs.

Subject: [FT100] Re: Stupid VHF/UHF antenna question

Thanks Jerry.

I have the Comet CA-2x4SR on the Subaru now opposite the ATAS, but at 36" it just hits the top of most parking garages (yes, I know, the ATAS is much longer, but I would rather worry about just one antenna than having to lower both).

The CA is on a K550 luggage rack mount and is 1/2 wave on 2m, 2x1/2 on 440. Works well and a good match based on the FT100D SWR meter.

I made the mistake of picking up a shorter SBB-2 to replace it, which is 1/4 on 2m, and 5/8 on 440. The FT100D doesn't like this antenna on the luggage rack on 2m (2.5:1). 440 is fine.

The SBB-5 is too long (38"), but the B-20 is only 30", 1/2 wave on 2m and 2x5/8 on 440. 6" shorter (enough to clear the ceiling) and shouldn't need a major ground plan. Off to HRO to swap it out...

I'm a firm believer in the flat ground plane despite the big black luggage rack on my wagon, especially after getting 40m back by moving the ATAS off the luggage rack and on to the hatch lip (see yesterday's post).

Thanks again,

Bill

For receive only it should be OK. But plan on problems if you transmit much on VHF/UHF. When you do buy a power supply big enough to handle it, go with a 35 amp supply. A few bucks more, but well worth it.

For those of you that like to experiment, a friend has located another thermal switch that you might be able to use as a substitute for the switch that Yaesu uses in their V/U fans mod. I have no idea what it looks like or whether it has normally open or closed contacts or even what temperature it switches at. It is used in the Alinco DR-6107 for the same purpose and he knows that it works because the other night his 50 watts dropped down to about 100mw when the finals got too warm. Its component id is TS001 and its parts number is 0HD5S-95B.

# 13199. RE: [FT100] MH-48 dtmf mic modiciation

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-29 03:42:18 UTC
From: Lee Devlin
Topic: 13196  Message: 13199

I have an FT1500 and was curious to see if I could use it on the FT100, but I found that the pinouts were different. SW1 and SW2 are on pins 1 and 2 on the FT1500 and the values for the resistors that feed into the SW1 and SW2 are different as well.

My intent was to modify the MH48 mic by removing the baffle and opening the hole and then do an A/B comparison of the mics, but as I began to match up the schematics, I noticed that no everything lined up properly.

The FT90 and FT8100 use microphones that are compatible with the FT100.

Here are the differences:

FT100/90/8100
Pin 1: SW 2 multi-function switching for P, P1, P2
Pin 2: N.C. (9600bps packet data output FT-90)
Pin 3: + 9 V
Pin 4: GND
Pin 5: Microphone Input
Pin 6: SW 1 PTT, UP, DOWN, Acc

FT1500
Pin 1: SW 2
Pin 2: SW 1
Pin 3: + 8 V
Pin 4: GND
Pin 5: Microphone Input
Pin 6: PTT/Clone

73,

Lee, K0LEE

There is a poll which asks the question whether
current owners would recommend the rig to others. It
has 74 votes accumulated thus far. You can view the
results by visiting:

http://groups.yahoo.com/group/FT100/polls

You can also vote if you haven't done so already.
I'll probably conclude this poll in a few days.

73,

Lee, K0LEE

# 13201. Re: ATAS - no match on 40 -- UPDATE

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-29 04:24:11 UTC
From: recurve95
Topic: 12453  Message: 13201

Hi Bill,
I dont have the ATAS antenna, (I am running a Tarheel Screwdriver antenna) so I may be making observations and comments that dont apply at all, but here goes anyway. I was looking over your impedance measurements that you took on 40 meters and something doesnt look right to me. I remember reading back in an old ARRL handbook on mobile antennas that center loaded whips and even base loaded whips for mobile use needed some sort of impedance matching on 40 and 80 meters. The antenna impedance on the upper bands is close enough to 50 ohms for a decent match without too bad a SWR, and that was easy enough to tune out by adjusting the antenna. But on the lower bands, I seem to remember feedpoint impedances were about 15 to 20 ohms depending on the quality of the loading coil and grounding of the antenna. This held true with my modern screwdriver antenna, and when I installed my screwdriver (just the antenna, with no impedance matching coils at all at the base) in my Silverado truck, the actual antenna impedance measured 16 ohms by a MFJ 269 analyzer on both 80 and 40 meters. As i went up in frequency, the antenna impedance went up as well, to a high of about 36 ohms on ten meters. Using the values in the ARRL handbook for matching mobile antennas, I needed a small coil with a couple of uH inductance to transform the feedpoint impedance upward. I had some coilstock that was one inch in diameter, and ended up with about 6 turns in the coil. One end of the coil is grounded and the other end goes to the base of the antenna or center of the coax. On a one inch coil form, 6 turns is about 1.5 to 2 uH of inductance (memory only..i dont have the book in front of me). I put the MFJ back on the installation after the matching coil was installed, and indeed, the feedpoint impedance was now 50 ohms with no reactance. THe one thing in your post that bothers me is that your feedpoint impedance is very very high. While I dont have a good explaination for it, it makes me wonder if the ATAS has some sort of impedance matching network at the base that has too much inductance or capactance? COuld it be the luggage rack is acting like a capacator?(most likely to me). If so, you might not be able to mount it there without tuning out the high impedance of the feedpoint. If you really want to mount the ATAS on the luggage rack, I would suggest an "L" network matching scheme that you could build up in a small box. Ideally it would be mounted at the base of the antenna, but you can mount it at the radio, tune it on 40 meters for 50 ohms and forget it. The ATAS should be able to take care of itself on the other bands. As a side comment, the screwdriver antenna that I am using suggests strongly that the grounding braid from the base of the antenna not be longer than one foot. I mounted my screwdriver in the bed of the truck and drilled a hole in the bed to run the ground braid through, and have it bolted to the truck

frame. Total length of the ground braid on my install is 10 inches.
If you care to see what I am talking about,
www.geocities.com/recurve95
There should be a few pics there of my install.

There were no known mods to any of the radios built prior to May 2001. The FT100D saw a Firmware revision but suffers from the same two problems related to earlier models. Even if you have a May 2001 and crack the cover and find the swr mod, chances are it will still need the fan mod as no evidence has been shown that the May 2001 contained any firmware upgrade to protect the vhf and uhf final by liberal use of the fans. Even some of the May 2001 radios did not contain the swr mods so sometime in that run they started straightening out the swr falsing problem. Regards.. Richy N2ZD

# 13203. re: FT-100 & 6M

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-26 10:09:37 UTC
From: P. J. Kerrigan
Topic: 13203  Message: 13203

I finally got 6m working well on my FT-100 mobile. Found Hamsticks work great - get under 1.5 SWR between 52.3-50.1 Mhz.
I've never been able get less than 2.0 SWR (3-4 bars on the built-in SWR meter) with the ATAS-100, even with manual adjustment.
Anybody have a different experience here?

Also, been thinking about getting a mobile halo for much more punch on SSB ground-wave - M2 makes one, any other suggestions?

As a footnote - as folks have pointed out - be prepared for lots of silence. I was on top of Grizzly Peak in the (SF) East Bay, on a Sunday afternoon/eve, scanning both FM and the SSB portions of the band with no traffic. Called a bunch of times on the SSB calling freq, ditto. This is having line-of sight to the 2nd highest density of active hams in the world.

I had an "Old Timer" in the car who sadly shook his head - when he was licensed for the first time in the 60's, your big challenge with 6m was to find a *free* frequency.

PJK - KG6DHE

From: TM
Topic: 13205  Message: 13205

Hi all I sent my 2 FT100D's in for the warranty mods in Feb. Today I contacted Yeasu and they are being packed up today shipped tomorrow. Can't wait. I did have another problem that develope with one radio as it warmed up it would give static sound, key it and it work fine then after a min went back to the open squelch sound. Yeasu said they found the problem to be an IC problem and replaced.
Glad I played with it a bit before sending it in. One friend sent his radio in and came back, after 3 days the channel selector (Lower Left corner) was jumping channels when he wanted to only to go one channel. Yeasu told him to send the whole radio in but my friend asked if he can just send the faceplate in. Turns out they don't have replacements for the 100d yet. Also this friday Yeasu is moving to a new location and will not be doing any work for a week. I was advise that this would delay repair work by 2 weeks... De N8NET

# 13208. Re: [FT100] Grounding,Grounding,Grounding

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-28 17:20:38 UTC
From: Paul Manuel
Topic: 13154  Message: 13208

The bottom line is, we expected the FT 100 to operate into the antennas
our other rigs will--my 2 FT 100s wouldn't.

We expected the FT 100 to operate into a dummy load without breaking into
a spurious oscillation--my 2 FT 100s wouldn't.

We expected the FT 100 cooling fans to run when the rig got hot on VHF or
UHF, as they do on HF--my 2 FT 100s didn't.

I guess the ICOM 706 owners are just so much smarter than us because their
rigs usually work out of the box, into their usual antennas, as my 706
did.
I guess I was smart, like you recent posters, when I bought my 706 in
1997, and somehow got stupid when I installed my 2 FT 100s.

Thanks for your thoughts on the 6m Hamstick, PJK. I'm going to go that route for the time being, but I'd rather have an ATAS-100. Like your area, not much activity on 6 meters. If we don't start using it, there are a lot of commercial interests just waiting to pounce.

I don't have their e-mail address. Your best bet would be to call them at 562-404-2700. They are moving to a new location, starting tomorrow, 3/29 and will be available for phone calls on 4/1. You will need to hit the Ø key on your phone and then ask the switchboard operator to transfer you to the Service department.

Good Luck. Boy, if I had sent mine in in January and was still waiting, I'd be livid.

The answer to this and many other questions can be found in the FT100 FAQ/Knowledgebase at:

http://www.k0lee.com/ft100faq.html

Normally, this FAQ address is attached to the bottom of every email that is sent from this list (after the Yahoo ad). However, about half of our members only access the messages via the web page and the address of the FAQ isn't as apparent while reading in that mode.

I should also mention that FAQ stands for Frequently Asked Questions. I realize that some hams are making their way on to the Internet for the first time and may not be aware of all the acronyms that are used.

Sometimes there is a tendency to chastise people who ask a question that has been answered here many times. Please try to put yourself in their place. Remember the mic fright you had after you got your ham ticket and the other hams took mercy on you and didn't make you feel ashamed about your radio technique? Well, we need to extend the same courtesy to hams who are venturing into this group for the first time too.

From the last entry in the FAQ:
In the U.S.A., you can reach Yaesu as follows:

Amateur Technical Support: amateurtech@...

For parts: yaesuparts@...

For sales: amateursales@...

By postal mail: Yaesu U.S.A., 17210 Edwards Rd., Cerritos, CA 90703, U.S.A.

By phone: (562)-404-2700

# 13214. RE: [FT100] MH-48 dtmf mic modiciation

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-29 05:46:09 UTC
From: Eric van de Weyer
Topic: 13196  Message: 13214

Hi Lee,

Greg actually bought the mic over a little while ago and I had a look at it. Actually the pinouts are almost the same except that the PTT is on it's own on pin 6 which is the SW1 line on the FT100. the SW1 is on pin 2 which is nothing on the FT100. SW2, Mic, Gnd +9V are all the same. Therefore the MH48 will work as a basic or emergency mic on the FT100 but only a couple of the functions work. The DTMF does not work as abviously it is done inside the rig on those radios that use it.

73....Eric VK2KUR.

Subject: RE: [FT100] MH-48 dtmf mic modiciation

I have an FT1500 and was curious to see if I could use it on the FT100, but I found that the pinouts were different. SW1 and SW2 are on pins 1 and 2 on the FT1500 and the values for the resistors that feed into the SW1 and SW2 are different as well.

My intent was to modify the MH48 mic by removing the baffle and opening the hole and then do an A/B comparison of the mics, but as I began to match up the schematics, I noticed that no everything lined up properly.

The FT90 and FT8100 use microphones that are compatible with the FT100.

Here are the differences:

FT100/90/8100
Pin 1: SW 2 multi-function switching for P, P1, P2
Pin 2: N.C. (9600bps packet data output FT-90)
Pin 3: + 9 V
Pin 4: GND
Pin 5: Microphone Input
Pin 6: SW 1 PTT, UP, DOWN, Acc

FT1500
Pin 1: SW 2
Pin 2: SW 1
Pin 3: + 8 V
Pin 4: GND

Pin 5: Microphone Input
Pin 6: PTT/Clone

# 13216. Re: FT100 & 6 meters

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-25 22:03:21 UTC
From: backhoefade
Topic: 13073  Message: 13216

I have had great success using a G5RV Junior in an inverted vee configuration with the apex only at about 25 feet. I get 5-9 reports out of Nova Scotia from my Northern California QTH using my FT-100D at 100 Watts PEP. But, of course, you have to wait for the band to open up. Funny thing I've found is that the the band may be open and everyone seems to be listening and waiting. So go ahead and throw out an occasional CQ even if the band seems dead.

Subject: [FT100] Fw: FT100-D: MARS Capable?

Can the Yaesu FT-100D operate on MARS frequencies?

If so, how difficult is it to do? Is a modification required, or can you
just select the right menu option?

I'm thinking about purchasing a FT-100D as my primary mobile and secondary
(backup) base rig.

73s,
Tony/WA8SSQ

> Anybody have a different experience here?
> << SNIP >>>

I have run the original FT-100 for about 2 years now. I use the ATAS for 6-40 meters, and a Comet 2/440 dual band, both mounted on top of my Blazer via a homebrew roof mounting bar. I have had excellent tuning on all bands (even 12 and 17) from day one, never more than 1 or 2 bars of reflected power showing on the rig's SWR indicator, and always full output according to my Bird 4410.

Double checking the SWR with my MFJ 259B confirms less than 1.5 to 1 SWR on any band. I might add that this rig is bone stock (no SWR mod), but I did go to great lengths to ensure that the rig, antennas, *and* the body panels, hood, doors, chassis, tailpipe, etc. were properly grounded. This combo works great for me, and I am constantly amazed at how well the ATAS works - considering it's size.

I forgot to mention that, yes I had used an inverted Vee that's oriented east-west and have gotten QSO from all directions. I don't have enough data to say how much better it is off the east - west as compared to the ends,but it has been good enough to pretty well cover all compass points depending on the type and intensity of the opening.

I have had great success working 6 meters with a G5RV Junior in an inverted Vee configuration. When the band is open I receive 5-9 reports often from Nova Scotia. I'm in the SF area so that's a pretty good haul with just the barefoot FT-100D.

My FT-100 safely arrived at Cerritos, CA on 23-March-02.
The tech said three to four weeks for warranty repairs.
I'll advise when it returns.

Subject: [FT100] Re: Is my radio at risk? Advice would be VERY appreciated!

Hey Guy,

Firstly, my condolences on the loss of your Dad, I lost my dad
when I was 21 and my Mom at 24. At 34 I buried a child so I can
identify with you on the lack of hamming and such. I hope you are
doing well now..

With that outta the way, I can tell you that your radio most
assuredly doesnt have any of the mods and a call to Yaesu as
mentioned will get you no further information as they "bend the
truth" from what we have determined here.
If the radio is out of warranty, check with Yaesu to see if they
will cover the mods if its returned, specify in writing that you need
the Fan Mod and the SWR mod. The fan mod will cool things down inside
the rig and the SWR mod will make the radio more stable on HF and as
reported, clean things up on UHF and VHF as well.
If you want to do the mods yourself, check out the files and photos
area to the left of the website page.. Regards. Richy N2ZD

My ATAS 100 does a FB job through out the 6MTR band. I did have to change the whip to a slightly (4 inches)longer. this helped in 2 ways. ti brought resonance on 40 mtrs wher the antenna did not have to extend as far (all the way)as it did prior to chaging the whip. I did have a problem with the ATAS 100 locking at fully extended and have to give it a tap or 2 to get it to retract or start to.

> Also, been thinking about getting a mobile halo for much more punch on SSB
> ground-wave - M2 makes one, any other suggestions?

there is a pretty nice one (Halo) on www.6mt.com that can be built for ALOT less then what an M2 or ther Halo could be bought for. look a the 6 mtr Tech list for the diagram and article associated with the building it.

I will say that you are in the midst of what is between the 2 major DX seasons for 6 mtrs. We saw some really great openings here in NE FL in NOV.,DEC. and JAN into Europe and here in the next few weeks we

can look forward to more and longer openings within the states and into South America. These E and tropo openings can extend as far north as well into the Far North West territories in Canada and and well into South America from EM90FH (Jacksonville FL. The Summer will be alot like your buddy remembers what 6 mtrs used to be like. you will find guys all over the 50 MHz Section of the band operating SB and AM. One Problem with 6 mtrs is the fact that no one wants to be the first to key up so very few call CQ because they don't hear antything. I can't remeber how many times I have called cQ on a band that was quiet and had 20 or 30 stations calling me back because they didnt hear anyone..HIHI.
> PJK - KG6DHE

Ok I have rambled on enough rambling about my favorite band
73 and all the best and please email if you want more info and 6 mtr hints

# 13223. Re: ATAS - no match on 40 -- UPDATE

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-29 14:09:06 UTC
From: w1pa
Topic: 12453  Message: 13223

The bottom three inches of the ATAS is a "Z" match. Don Johnson's DK3 now has the same design, where the entire antenna is DC grounded through a coil at the base of the antenna. Don cuts a spiral groove in the bottom 6" of the tube to make the coil. In the ATAS there are multiple matching caps at specific taps along the coil as well.

Picture here (takes a second to load --600Kb):
http://groups.yahoo.com/group/FT100/files/ATAS-100/ATAS100.doc

This "part" of the ATAS is non-user fixable and $160US to replace. Be gentle on your mounts. (if anyone has a brokon one of these and wants to part with it, I'd like to try some techniques to offer a fix for them, drop me a note. I've already torn apart one).

```
---)))))))-----------------)))))))))))))))-------------------
| ^
| |
| |
Gnd cntr
```

All I know is getting the ATAS off the luagge rack and onto the body of the wagon has given me back 40m, as well as a better overall match on the other bands.

Yes, the FT-90 and FT-100 mics are functionally interchangeable, except for front button labeling. But I did see some goofy operation using the FT-90 mic on the FT-100 in the cold. So MABYE there is a difference?

Hi Pres,

I'm afraid you are wrong on this one for two reasons.

Firstly, if you open up the mic you will find that there is no generator chip inside it. there are only some resistors, diodes and transistors.

Secondly, if you connect the MH-48 up to the FT-100, pressing some of the DTMF keyboard keys, has the same effect as pressing some of the function buttons, thus proving that the keys are, in fact, connected to either the SW1 or SW2 lines. Also, no tones are produced.

I did these tests on one earlier today.

Nah, I took a MH-36-xxx mic from a FT-100, changed the plug, and now it
works on the FT-817.

Thanks

One of the reasons I bought the FT-100D was because of the knob.

Steve; u can use a K9000 and modify same for the ATAS100. It will
raise an lower the ant but, its not really heavy duty enough for the
torque moments of an ATAS100.

I am now designing a motor drive unit around this:
DC gear motor:
http://www.allelectronics.com/cgi-bin/category.cgi?category=400400&item=DCM-178&type=store

Really nice piece of stuff. U can put the GMC on this and rotate the
whole car! Hi.....

# 13235. Indoor Antenna

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-29 18:51:18 UTC
From: frankweiss@aol.com
Topic: 13235  Message: 13235

Good morning everyone.

I am very interested in the FT-100D. Initially it would be for home shack use. As a first antenna, I am thinking of the MFJ 1621 antenna.

http://www.mfjenterprises.com/products.php?prodid=MFJ-1621

Does anyone have any experience with the antenna and also mating it with the 100D?

Thanks.

# 13239. FC-20 and ATAS-100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-30 02:40:53 UTC
From: Michael A. Waldron
Topic: 13239  Message: 13239

I know this is a stupid question, but.....

Can I connect the ATAS-100 to ANT-B on the FC-20 and another normal antenna to ANT-A while still using the FT-100 (with the switch set to B and the menu set to ATAS) to tune the ATAS, then switch the menu option and AND button to use the other antenna?

I guess the question boils down to will the voltage be passed through the FC-20 to the ATAS, and will this damage the FC-20?

Thanks!

I've got the 1622, it's similar but includes a window bracket and can also be used for 6 & 2 meter, The 1621 is a mobile so don't forget to use a counterpoise with it if your gonna use it at home. Generally it does what they say I had to put better coax on mine and it can be touchy to tune untill you find the right spot for the bands your using.(it use's the wonder lead). Being a condo dweller I've been satisfied with the 1622 and on 2m it really surprised me. The biggest warning I can say is remember to turn the power down on the radio while adjusting the wonder lead. Hope this all helps.

No, that's an entirely different antenna. The 1621 is an antenna tuner with a telescoping whip on it & ~50 ft. of coax (which, to my mind, makes tuning a bit difficult unless you have REALLY long arms). Check the reviews on eHam; IIRC, folks weren't very happy with it.

The 1622 is a largish air-cored coil with wander leads & a telescoping whip (they call it a mini-bugcatcher). They also make a mobile version of the 1622, which is the 1624.

But that's a different kettle of fish.

You are using a mic which DOES have an encoder in it on a different rig.
That'll work OK but the MH-48 on the FT-100 won't as far as the DTMF goes.

That's fine... I thought you were saying the MH-36-xxx has no tone generator in it...

So you're saying the MH-48 touch-tone mic will fit with modification, will talk on the other rigs but no tones because they are generated in the rig? Wow... how do they send the button-press info to the radio?

I wonder if he is thinking the same thing I have thought about - connect ANT-B on the FC-20 to a 75M Ham Stick. This would be a good setup although I have heard of people forgoing the ATAS altogether and getting decent results out of just the Ham Stick and the FC-20 on all bands.

# 13246. Re: [FT100] FC-20 and ATAS-100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-30 16:56:02 UTC
From: Michael A. Waldron
Topic: 13239  Message: 13246

I have a dipole as well as the ATAS at my apartment.

I cannot leave the dipoles outside when it is light out (management frowns on antennas) so I want to use the ATAS-100 which I can force to collapse and not be seen during the day, or when it's 10F outside and I don't feel like going out to screw the dipoles together.

I cannot always use the ATAS because it does not tune everywhere (lack of decent ground).

From: Michael A. Waldron
Topic: 13239  Message: 13247

Exactly, I have a set of hamsticks for 20m and 6m that I use in a dipole configuration, but I can't have them outside most of the time because of apartment rules.

# 13248. Re: [FT100] FC-20 and ATAS-100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-30 17:45:27 UTC
From: Dick Thompson
Topic: 13239  Message: 13248

It's possible, Kevin. But my experience with Hamstick type antennas is that once you know where they load properly you don't really need a tuner. Besides, the FT-100D has the ability to show the SWR or at least a generalization of it.

Subject: [FT100] FC-20 and ATAS-100

I know this is a stupid question, but.....

Can I connect the ATAS-100 to ANT-B on the FC-20 and another normal antenna

to ANT-A while still using the FT-100 (with the switch set to B and
the
menu set to ATAS) to tune the ATAS, then switch the menu option and
AND
button to use the other antenna?

I guess the question boils down to will the voltage be passed through
the
FC-20 to the ATAS, and will this damage the FC-20?

Thanks!

-Mike

# 13251. Bad Mic

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-30 21:38:35 UTC
From: ftbratton
Topic: 13251  Message: 13251

I had the first problem with my 21/2 year old FT-100 this week. The mic keys at the least movement. It even will key occasionally when sitting idle in the seat. I suspect the mic but will borrow an FT-100 mic to confirm. The local ham radio store doesn't stock them. Apparently mine is the first to go bad. Has anyone has this problem before?

Also, I broke down and bought an ICOM 706 MKII--not G--just to see for myself which one is the best. I think I already know but the Icom will sell quickly anyway. What tuner would the group suggest that would align with both the 100 and the 706?? I have heard good things about the LDG and the SGC's. I would like to get the best of the choices. I have thought of using a long whip in my truck as well as the ATAS. Being a salesman, a whip is testing management too much on the car. The ATAS will have to do there----and has quite admirably, in my opinion. If the 100 wins, as I suspect, I will either trade or sell the 706 toward a new 100 or get an interface for the ATAS. Is the Am-Con the best choice? You don't appreciate how convenient the ATAS is until you have a radio that it won't work with and have to look for a way to match an antenna. If removability and convenience is a factor, there is no match. It might be topped by some other mobile set ups but if it is topped by one as easy to remove, quick and convenient, I certainly wish I knew what it was and where to order it.

Thanks,
Freddy Bratton

From: Trm Martens
Topic: 13252  Message: 13252

I know this is a stupid question, but.....
What I do in my RV for 80 Mts. is (using a a/b switch) switch coax to a Hamstick and change menu #61 to off and carry on. No reason I can see that the tuner can't be in there. Then you would put #61 to tuner. When you switch back to ATAS 1 of ATAS 2 (whichever you use) you must remember to give the ATAS time to reinitialize itself (takes 60 - 90 seconds) 73, Tom VE6TRM

From: jamesmurtagh
Topic: 13220  Message: 13258

Yaesu received my FT-100 for out of warranty repair on January 22nd. As of Thursday, 3/28, the radio still had not been assigned to a technician. I was quoted a four-six week turn when I called Yaesu in January to inquire what may be wrong with my receive fading out when the radio becomes warm.
I get one excuse after another from Yaesu. The FT-100 is a great radio when it is working but I drive too much to be without it for 3++ months! Mine may be on the market when it returns...

Apologies, its off-topic I know but....

I lived in Kuwait for 8 years and had the call 9K2FP, it was great fun and I enjoyed every minute. Sure it didn't have all the trappings of life back home but there were many compensations. The social life was better, people seemed to make the extra effort to mix and entertain guests. For those that embibe, wine and beer weren't a problem, we used loacl ingredients and made our own. The Kuwaiti's maintained a tolerant attitude to that so long as you didn't sell to the locals. The beaches were second to none and made for great parties, fishing trips, barbeques, lazin' around. The desert bloomed in their winter, it literally covered over with a mass of flowers and grass. The Kuwaiti maerkets (souks) were an experience not to be missed, I never seemd to tire of them and you could buy anything there that you needed. The gold souk was the wife's favourite 'haunt', anything there less than 21 carat was considered to be of poor quality!
The Kuwaiti's I found to be a hospitable people, friendly and sociable family loving. Crime hardly existed, punishment was swift and effective!

Did you try another rig out on it?
I'd suspect the antenna center connector, coax PL259
or maybe the 1:1 balun connection at the 450ohm/RG-8
point.
Please post your findings if you get it to work.

From: k5unm
Topic: 13249  Message: 13263

I don't have the perforated style, I use CHROMERICS CCH-36-101-0100, which is CHO-FOIL Conductive Tape, Copper foil (1 oz.) with conductive adhesive. Maybe a call for a sample or purchase of a small roll.
CHROMERICS Inc.
77 Dragon Court
Woburn, MA 01888
800-225-1936
617-935-4850

Hope this helps you in your quest for EMI engineers magic tape, cures all radiation problems and susceptibility issues during qualifications.

> January to inquire what may be wrong with my receive fading out when
> the radio becomes warm.

Lucky you... I called Yaesu back in December and was told the
current turn-around time was 6-8 weeks. They got my radio on
Dec 26th. I didn't hear a thing about it until I called them on March
22nd. I was told the radio was just looked at on that day. For my
problem of no TX power on every band (nothing on HF, 6m, 2m,
or 70cm)... I was givin an estimate of $680 !!! I can go and buy a
new FT-100D at HRO for $830.

When I was talking to the person on the phone... they looked
over the estimate for the work and as he looked at it, he said
"now why does the tech want to replace that". He was suppose
to get back to me with a "new" estimate for my radio... but I
haven't heard from them yet.

I guess I'll have to call them back.

# 13273. Ft-100D Stock Mike De-Sense Audio Mod

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-03-31 15:37:43 UTC
From: n5ujj
Topic: 13273  Message: 13273

I've made this de-sense mod to several Yaesu Hand Mikes before and it cures the "HOT Mike" syndrome.

Solder in a 1/4 watt 2.2K resistor across the mike element in parallel.

I tried a 1K first like I've done on other mikes and it was too much attenuation of audio. I had to raise the MIC Gain to 90 for proper operation on HF. With the 2.2K I'm at 60 HF & 65 FM and the mike no longer picks up back ground modulation, i.e. wind noise at 70 MPH or Rock & Roll from the Juke Box Radio. I was at 40 HF and 45 FM before.

The reason I did this mod was my VOX keep tripping while going down the highway at 75 MPH with the windows rolled up! There is no Anti-Trip adjustment for VOX control on my FT100D. The threshold on the VOX Gain adjust is 10. Before, my VOX was tripping at 10 and not even working at 9. Now I'm at 30 on the VOX Gain with plenty of Latitude for adjustment.

You'll get the best Audio Reports from your contacts and they won't beleive you're on the same radio.

You may have success with a 1.5K resistor too. It's easy to experiment and find out what works with your voice pattern.

From: wb0dul
Topic: 13276  Message: 13276

I hope someone on the reflector can help and tell me what I'm doing wrong. I have programmed about 20 repeater and simplex frequencies into MG1 (Message Group 1, Channels 1 thru 50). On channel 2, I have 448.100. When I key the radio on any of the other 19 channels I can hear the repeater come back to me or if someone answers I can hear them. On Channel 2 in MG1, I can speak into the mic, see that I'm bringing up the 448.1 machine, but I can't hear a thing. Even with the squelch wide open there is nos sound. I can see the meter move when somebody answers me and If I go Reverse and they are close enough, I can hear them. Why can't I hear the repeater on this channel?

Across the top it reads MEM TSQ RP- MG1 002

On the left it reads:
TSQ
MCH

Step is set to 25K FM.

If anyone can help I'd sure appreciate it.

Happy Easter guys and gals.

You are in PL decode and the repeater must not be sending a PL tone.
Set your PL to ENC (encode) only by hitting the TON button several times.

Only the DSP button lights up red when in use and the clarifier button which lights up green when in use are backlit. All the others have no backlighting. The DTMF mic does have red backlighting on the numbers, but the numbers on the keypad can't be used for anything but DTMF tones. The other 6 buttons on the mic have no backlighting.

Hope this helps.

Chances are that the tone programmed into the channels you can't hear is incorrect or the repeater does not pass the CTCSS tone and the tone squelch on your radio is on. That's what the TSQ means. Try going into the TON menu and setting it to tone only, not tone squelch. Some repeaters in my area don't pass the CTCSS tone with the output audio and so I can't use the squelching feature. It's annoying because tone squelching can eliminate a lot of intermod. I tend to hang out on the machines that do pass the tone.

good luck,

Sean

Not on the ABCD buttons along the bottom and the buttons to each side of the display.. The only thing lit up is the DSP button when its active. The display usually throws off enough brightness to see the side and bottom buttons but when you get really good with the rig, you will not have to take your eyes off of the road as the buttons become second nature.. The mic is backlit but its a yucky red color to match the other rigs it was swiped from.. If this is a deciding factor in your purchase, you may want to consider what it does offer..
The ability to use a matching screwdriver antenna
The superior RX and NB when compared to the 706.
Its size

The downside is that most have to be modded for SWR problems (except for some of the May 2001 runs)
Add in a 29-50 ohm resistor to the fan logic (-)line, set your menus, mod the mic and your good to go..
If you live near a dealer have him pull a May 2001 from the shelf for you as most of em have the most difficult mod that it needs.. The other two mods (fan and mic) are simple.. Regards.. Richy N2ZD

# 13283. RE: RigBlaster Plus

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-01 02:56:27 UTC
From: Craig Stewart
Topic: 13276  Message: 13283

anyone out there using Rigmaster Plus and gets relay buzz or chatter when in Vox mode or when software is closing the PTT, got a new unit and wanted to try it and I am not sure if the unit is defective or something I am doing wrong.

when no jumpers are set and no mic installed if I put the power supply to the unit and set the switch to vox the relay buzzes very bad.
and when I set all the jumpers and test the Mic in Auto mode I can get the transmitter and that works fine but when I use the Vox switch or software I get a relay buzz.. any help would be great. thanks
73's KB8KPV Craig

# 13284. Re: [FT100] Re: Programming Memory Channels in FT-100D

Thanks, Kevin. I guess that's the DCS. I made a change there and all is right at present. As I mentioned to another who responded, it may be back to it's old ways in the morning. Thanks for the suggestion.

Subject: Programming Memory Channels in FT-100D

I hope someone on the reflector can help and tell me what I'm doing wrong. I have programmed about 20 repeater and simplex frequencies into MG1 (Message Group 1, Channels 1 thru 50). On channel 2, I have 448.100. When I key the radio on any of the other 19 channels I can hear the repeater come back to me or if someone answers I can hear them. On Channel 2 in MG1, I can speak into the mic, see that I'm bringing up the 448.1 machine, but I can't hear a thing. Even with the squelch wide open there is nos sound. I can see the meter move when somebody answers me and If I go Reverse and they are close enough, I can hear them. Why can't I hear the repeater on this channel?

Across the top it reads MEM TSQ RP- MG1 002

On the left it reads:
TSQ
MCH

Step is set to 25K FM.

If anyone can help I'd sure appreciate it.

Happy Easter guys and gals.

73,

Dick

You are in PL decode and the repeater must not be sending a PL tone.
Set your PL to ENC (encode) only by hitting the TON button several times.

From: Dick Thompson
Topic: 13274  Message: 13287

I have a good friend, WV7T who uses the FT-100D as a base station. In fact he bought 2 of them when he made his purchase. One for base station and one for mobile. He recently added an FT-817 for QRP.

Why wouldn't the FT-100D work as a base station? I've had mine for about a week (my regular base rig is the FT-920), but I have made contacts on SSB and FM. I haven't played with CW or the digital modes, but I know they will work.

Go for it.

Try changing the TSQ to ENC while on that 448.1 Repeater, may be its tone output on TX is low thus your receive is not decoding it.. You will find that you can not set SQL while TSQ is enabled !

Chances are that the tone programmed into the channels you can't hear is incorrect or the repeater does not pass the CTCSS tone and the

tone squelch on your radio is on. That's what the TSQ means. Try going into the TON menu and setting it to tone only, not tone squelch. Some repeaters in my area don't pass the CTCSS tone with the output audio and so I can't use the squelching feature. It's annoying because tone squelching can eliminate a lot of intermod. I tend to hang out on the machines that do pass the tone.

good luck,

Sean

Does anyone use a boom mike / headset for mobile use with the FT100D? If so what do you use and how does it perform. I know Heil make one specially for the Icom 706 but not sure if they have one set up for the FT100.

I want to buy one and would be interested in other users experiences first!

# 13290. Took Radio in For Rapair

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-01 13:23:54 UTC
From: larry cook
Topic: 13290  Message: 13290

Brother Hams,

Saturday morning after finding all the paper work on the FT100D, I disccovered my warrenty would run out on Sunday. So I ran up to AES in Orlando to get them to do the modes before the warrenty ran out.

After having the radio less then five minutes they took me back to the bench and showed me that the radio was fine and tuned it to a dummy load on all bands. I mean, I'm looking at it, and it is working. In disbelief, I picked up the radio and took it out to my Explorer. After hooking it up to my Outbacker I tuned into the 40 meter band, and it TUNED!

I don't know. Warrenty is out. But the radio is working, at least for now.

I like the radio and am going to keep it. And, will repair it if it becomes necessary.

By the way, I've had this same thing happen with several cars. Something goes wrong, take it to the shop, and everything checks out OK.

Life is great!!!!

OK, but they should have done the mods by your request.

Speaking of mods... mine, which went in months ago for customer-pay repairs and requested mods, has the copper-tape mod, and also an added thermistor, but also a bunch of felt-cloth-wrapped toroids on many wires and cables inside. This is something I have not heard of before.

Has anyone seen this?

PS today I added the 47-ohm 1w resistor to one of the fan black wires ( the other one was the thermistor )- works as expected.

Thanks

# 13297. ATAS100 disassembly problem

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-01 18:11:38 UTC
From: Jim LeFevre
Topic: 13297  Message: 13297

I am having a problem with disassembling the lower coil assembly from the rest of the antenna. We have tried some light techniques without success (WD40, hair dryer heat, hand-torque) and stopped, as this area won't budge. It seems to apply more force, or more heat may render the antenna unrepairable. I have slipped a small knife blade between the tube and the flange of the bottom assembly which breaks loose a white corrosion precipitate. As the corrosion is whitish, I don't think that it is an aluminum oxide, but three+ years worth of Michigan wx. Has anyone found, or know of, a procedure that will loosen this assembly without damage, possibly a chemical penetrator that works better than WD40? Jim KB8UNU

Hi

I have seen an instance where this phenonoma suddenly started to happen, without any changes in the PC configuration except, that Norton AV had made a liveupdate.

The set-up was in a small network where NAV was installed on both client PC and firewall/gateway PC, and both PC's scanned outgoing mail traffic. After disabling outgoing mailscan at the firewall PC, this stopped.

Best regards Lars

That is not a mod but the way the radio came from the factory. Mine has the felt covered toroids and it is one of the first ones delivered in the USA. Just keeps things from rattling around in the mobile environment and from flaking if they strike adjacent components.

The lower protion is a sealed unit, it has two small stainless stell pins which hold the sections together. You could gouge out the area around the pinds then use vice grips or such to pull them out. The base chrome unit that forms the outer ring of the PL259 assembly then can be unscrewed from housing. This then exposes the inner workings of this coil matching network by looking in the archives you can see scans of the inside of the unit I took a long time ago. Most people can't get the pins out and end up destroying the base unit. About $250 to replace it. So good luck at getting the pins out you will destroy the black plastic tube, use PVC from home supply store to replace it, paint it black.

How INTERESTING. In the three I have owned I never noticed them. So, if that was a production change, why the heck didn't they start doing the "mod" in production?

To remove these roll pins, you'll have to press them out from one side or the other. There are tools for this (punches), but you could probably make one out of a nail the same diameter.

Good luck!

Wrong, wrong The pins are blind and only go in far enough to secure the threaded pieces. If they went all the way through as you imply they would short out the center brass pin carrying the control voltage and RF. If you look closely at the lower assembly you'll see the pins in only one side and not the other.

# 13305. Base Station

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-01 20:22:24 UTC
From: russthom@attbi.com
Topic: 13305  Message: 13305

I bought my FT 100D specifically for the base. Having not been on HF for too many years, I didn't want to make a major investment in a radio that would gather dust. (I was upgrading from a 5 band radio) Anyway, I LOVE my FT-100D as a small base station.

I also bought a AT-20 antenna tuner. I feed a G5RV with it and work all bands (80-6) on that combo. I work mainly CW below 30 MHz and FM on 2 and 440. Once I got the high swr fixed. I have had a blast. The DSP is wonderful on CW.

I am no expert on rigs, my previous rig was a TS-120 that only had five bands. the FT-100D was such a step up anyway that I am thrilled with the rig. The only drawback is the menus.

The pins are also much harder metal than the surrounding bulk metal, so drilling them out with hand tools is impossible. You would need a good set of machine shop tools (end mill?). The old version has pins at top and bottom. The newer ATAS's have pin on the bottom, screw on the top. I tried to drill them out with the hope of tapping threads and replacing the pins with screws. Trashed it.

The base (bottom three inches) is $160, by-the-way, not $250. I replaced one last month. I still have the original that I destroyed trying to take apart. The failure modes here are the solder joints where the metal tabs at each end solder to the coil. I noticed in my busted one that the tabs align with the pin. I always wondered that with careful measuring on the busted one, I could fix another one by drilling two holes through the plastic directly above the solder joints (the tube is 3/16" thick teflon), re-solder them through the holes, and then seal the holes with silicone or heat shrink tubing and completely bypass trying to take this thing apart.

Image at:
http://groups.yahoo.com/group/FT100/files/ATAS-100/ATAS100.doc
(takes a sec to load - 680Kb)
One tab can be seen direcetly below the second "a" in ATAS, top image.

Have you confirmed that this is the problem? You should read a direct DC short from the metal of the PL-259 ground at the base, to the metal ring three inches up, just below the first set of covered screws. If not, one of those tabs are open. You should read 27K from center pin to ground (base), and from center pin to the metal ring three inches up.

Does anyone have one of these base units that _is_ busted, either for free or for a small charge, that I can try my theroy on? If I'm successful, I'll post the details and a drill guide to the list. Send me email direct.

Sorry if I was not clear enough Mike. I am attempting to separate the coil assembly from the motor tube. I am not trying to disassemble the coil assembly! There are three chrome-plated screws that, once removed, should allow the o-ringed coil assembly to be separated from the motor assembly tube. Corrosion is holding the coil assembly tight. Goal is to replace motor and/or circuit board once we can disassemble the antenna.

Ah! then we lead you down the golden path for naught.

The motor tube assembly and the rest just slide apart, if there is corrosion then it will be difficult, but they just slide apart when the screws are removed. Now the corrosion issue you were having makes sense. Sorry for the miss direction.

> WBØDUL@a...

The failure mode is that with constant removal and placement, or if you get in the bad habit of tightening the ATAS down by grabbing above the bottom three inches, the coil will turn slightly inside the tube. With repetative torqueing, the movement of the inner coil will stress the solder joints to the two tabs, and one of them will fail open.

It will initially show up as an intermittent issue. Since the ground of the H-block board (the little PC board that senses the voltage and controls which way the motor turns) is connected here, the ATAS stops turning and you think you fried the board or the motor. You'll press tune and nothing will move. You give the antenna a bit of a turn, and low and behold it works for a bit, and then the next time you hit tune, it doesn't...

You can check the motor by putting 6v on it's connector (I don't think anyone has ever had the motor itself fail)
You can check the PC board by taking a resistance check right on the board (remove the top tube and pull out the motor board assembly as described in the FAQ), center pin to ground, 27K. ($16 to replace)
Good connection on the SO-239 of your mount? A loose center pin connection (remember, each time you put the ATAS on you are spinning that center pin into the mount SO-239) will give intermittent problems; drop a small spring in the hole first as desribed here on the list (I found the spring from a pen is a bit too large, but one from a cheap mechanical pencil will work great).

If all of these are ok, your failure mode is likely what I just described (send Yaesu $160 US).

Been there, did that, drove me freakin' nuts.

My original one suffered a seagull impact and killed both the bird and my ATAS100. Had it mounted on a homebrew roof plate between the luggage rack rails on my old Explorer. Doing 70mph on I4 near one of the lakes, made a hell of a noise, thought someone ran into me. The usual problem I've seen and read about is the solder joints failing. The matching network is on a hard plastic core with a long chromed brass center pin. The flexing as you drive doesn't look like much but the moment arm stress on those plastic pieces eventually causes a failure. The cure would be a carbon composite inner core and also a carbon composite outer covering. This then would come close to the structural characteristics of the chromed brass center pin and the rest of the aluminum structure. Gues I'll have to create a complete image of the disassembled matching coil unit sometime.

That connection has an o-ring seal. Must be a good chunk of corrosion. I'd WD-40 into each of the three screw holes to try to break it free.

And Mike, thank you so much for posting the original note and images of that base coil taken apart. I would have been so lost without it when I rebuilt the "fully functional" unit I bought from another ham on ebay and learned all this wonderful stuff about the ATAS. My sincere thanks. That's why I'm so anxious to come up some usable method to fix one of these.

Jim, I'm glad this _isn't_ the problem you are having. :-)

My story is similar. I needed another compact base transceiver after I got married since we owned multiple properties. My prior rig was a TS-520. The FT-100D turned out to be one heck of a performer. I do a lot of CW work and the combo of the 500 Hz crystal filter and the variable bandpass DSP, along with the bullet proof receiver front end (overload performance) completely sold me. The receiver is outstanding. I use the rig on occaision in the car but for the most part it stays at home; dwarfed by the SB-220 that sits next to it. I use the G5RV "Junior" version (about 51 feet long) at about 35 feet in an inverted Vee config and it works out very well. Just one neat little rig! I don't mind the menus at all. Got used to it and flip from one function to the next including F menu items without much thought at all. Only complaint, which is pretty trivial, is the fan noise. But I can always put on the headphones.

*****Steve, I use the Hiel HB-5-5 headset for my FT-100 mobile operations and I love it.
Hands free ham operation mobile is the way to go, just let the VOX do its thing. This has a single earphone and the reg chewers mic element. The only thing I don't like is the need for two adaptors to connect the headset to rig. See http://www.heilsound.com/BM10.htm for info.
I have the Clear Speach speaker and jumpered the switch in the jack and put a 100 ohm resistor in series with the earphgone so there is a rough ballance between the audio I hear from the speaker, incase you just wanted to monitor without the headset, and the audio I hear on the earphone.
Hope this helps. BTW are you any where around Kent? I will be over there in June for 3 weeks.
Cheers, John K2GVP

The failure mode is that with constant removal and placement, or if you get in the bad habit of tightening the ATAS down by grabbing above the bottom three inches, the coil will turn slightly inside the tube. With repetative torqueing, the movement of the inner coil will stress the solder joints to the two tabs, and one of them will fail open.

It will initially show up as an intermittent issue. Since the ground of the H-block board (the little PC board that senses the voltage and controls which way the motor turns) is connected here, the ATAS stops turning and you think you fried the board or the motor. You'll press tune and nothing will move. You give the antenna a bit of a turn, and low and behold it works for a bit, and then the next time you hit tune, it doesn't...

You can check the motor by putting 6v on it's connector (I don't think anyone has ever had the motor itself fail)
You can check the PC board by taking a resistance check right on the board (remove the top tube and pull out the motor board assembly as described in the FAQ), center pin to ground, 27K. ($16 to replace)
Good connection on the SO-239 of your mount? A loose center pin

connection (remember, each time you put the ATAS on you are spinning that center pin into the mount SO-239) will give intermittent problems; drop a small spring in the hole first as desribed here on the list (I found the spring from a pen is a bit too large, but one from a cheap mechanical pencil will work great).

If all of these are ok, your failure mode is likely what I just described (send Yaesu $160 US).

Been there, did that, drove me freakin' nuts.

I use a 706 as a base now, but that is only because I
prefer the Noise Blanker in the 100D for mobile work;
I'd use the 100D as a base with no complaints!!! I
have a small house right now, so space is at a premium
- but I'm closing on a bigger property that already
has a tower in good shape!!!!!

Dick,

I wouldn't let it discourage you from buying one. The base-coil-open seems to be a rare occurance. Understanding that the ATAS is a mechanical beast first and foremost, and that it does require a bit of routine maintainence, I would buy one again in a second. Nothing like the relatively small size (vs other screwdrivers) and being able to change bands without stopping. I ran an Outbacker for years, excellent performer, but one button tuning with the 100/ATAS combination is pretty slick.

Jim -

I think you are trying to remove the matching network and motor drive assembly from the main black aluminum tube -- that is, you are not trying to get into the matching network itself. You have slid up the lower rubber cover and removed the 3 screws.

I had mine apart when it was relatively new, and yes, it does corrode in the gap at that joint. There is an internal O ring that is supposed to form the seal, but it seemed to me that the corrosion process was attacking the inner surface of the aluminum tube and working its way beyond the O ring, so when I re-assembled it I used some rtv to fill the gap and form a first line of defense against water. I have not opened it up almost two years now, so don't know if I was successful.

Anyway, my suggestion re your disassembly problem is to use an impact technique. Grip the tube securely, maybe in a vise or maybe just have a helper hold it down on a bench, and use a hammer and some tool (chisel? screwdriver?) to tap on the flange, as parallel to the axis as possible. I would think lots of taps, alternately on opposite sides and working your way around it many times would have a good chance for success with not much chance of damage. When it finally breaks free, you will see it start to move little by little - it probably won't go flying. Light taps at first, then heavier as your frustration builds.

gl,
Ed, K1GGI

Look into a Comet/Diamond multiband such as the HV-7A. No tuning during use,
although they make you pre-tune certain segments of the lower bands

I think it may have been hit by a Mack Truck first then dropped. I don't know what parts would be salvagable.... Somebody needs to really be desperate for parts, even the filter board looks like it is a long shot if they are good. Doesn't take much of an impact (Mack Truck) to destroy the crystal lattice structure. Maybe it was bounced along the roadbed for several miles. Some one would rate that FT747 in mint condition.....

Subject: Programming Memory Channels in FT-100D

I hope someone on the reflector can help and tell me what I'm doing
wrong. I have programmed about 20 repeater and simplex frequencies
into MG1 (Message Group 1, Channels 1 thru 50). On channel 2, I have
448.100. When I key the radio on any of the other 19 channels I can
hear the repeater come back to me or if someone answers I can hear
them. On Channel 2 in MG1, I can speak into the mic, see that I'm
bringing up the 448.1 machine, but I can't hear a thing. Even with
the squelch wide open there is nos sound. I can see the meter move
when somebody answers me and If I go Reverse and they are close
enough, I can hear them. Why can't I hear the repeater on this
channel?

Across the top it reads MEM TSQ RP- MG1 002

On the left it reads:
TSQ
MCH

Step is set to 25K FM.

If anyone can help I'd sure appreciate it.

Happy Easter guys and gals.

# 13326. RE: FT-100D as "base station"

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-02 01:32:13 UTC
From: Gorsline
Topic: 13326  Message: 13326

I purchased a FT-100D last November as the main rig for my second location at the summer cottage and as back-up for the main rig. Wanted something that could do a creditable job chasing DX on both SSB and cw. This is given that the main station rig is a Mark-V and withdrawal symptoms are painful. There are a few others on this list who have done the same, the DSP filtering and menuing are similar to the Mark-V and performance is quite good for a little box. Have only made a dozen or so QSOs with it so far, but it behaves as you would expect from any good quality rig, including handling about the same excursions on SWR on my beam as big rigs.

Given the many comments on the reflector, perhaps how I was taught to tune up by an old ham many years ago might be helpful to pass on:
Adjust the antenna tuner by sending a string of dits until low SWR is achieved. NEVER use continuous carrier - key down! When tuned, then switch to SSB (or whatever) if going into that mode. This saves the finals by keeping the duty cycle low and is easier to do than menu adjusting the power down and up again. Key down is lots of heat - always bad in any rig, worse in smaller ones that are hot to start with. The bad news with transistor finals is that they can only glow cherry red once - vacuum tubes were more forgiving.

Have my fingers crossed on the VHF/UHF finals problem - still hoping that somebody finds a reasonable alternative should I ever need one. So far, so good...

# 13328. FT-100D One-Touch Tune to be shown at Dayton next month

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-02 05:36:07 UTC
From: w4wb
Topic: 13328  Message: 13328

If you would like to see the One-Touch Tune for the FT-100D (not the FT-100) in action, please drop by our booth at Dayton. The booth will be located just across the aisle from Bob Heil's booth. We will also be demonstrating the LDG Electronics AT-11MP and RT-11 autotuners (plus the Z-11 for the QRPers). Likely to have special "Dayton pricing" on the OTT-100D and the LDG autotuners.

Unless you use the ATAS-100 or the FC-20 tuner with the FT-100D, using a tuner with this rig is not such a pleasant task. Also, you cannot use the CAT function when the FC-20 or ATAS-100 is used. With the W4RT Electronics FT-100D One-Touch Tune (OTT-100D), you retain the CAT functionality and can use both manual and autotuner with a constant carrier!

This OTT interfaces wonderfully with the LDG Electronics AT-11MP and their new RT-11 autotuners. All you have to do is just touch the TUNE button on these tuners and the tuning automatically happens. The OTT-100D will allow you to interface with many other autotuners (not the FC-20) and all manual tuners. For more information, please see www.w4rt.com and look in the Hardware section.

Hope to see you in Dayton.

# 13332. Re: [FT100] FT-100D One-Touch Tune to be shown at Dayton next month

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-02 16:03:06 UTC
From: Dick Thompson
Topic: 13328  Message: 13332

I was planning on being at Dayton, but have a granddaughter graduating from high school that weekend. (I never thought she'd make it, so I ordered my ticket. Hi Hi). Anyway, since I cancelled my wife told me to go ahead and buy the radio I had planned on buying at Dayton. I now have the FT-100D as a consolation prize. (I love it when she talks dirty.)

from what you said I guess I can assume that if I buy the ATAS-100 antenna system I won't need a tuner.

73,

Dick

Subject: [FT100] FT-100D One-Touch Tune to be shown at Dayton next month

If you would like to see the One-Touch Tune for the FT-100D (not the FT-100) in action, please drop by our booth at Dayton. The booth will be located just across the aisle from Bob Heil's booth. We will also be demonstrating the LDG Electronics AT-11MP and RT-11 autotuners (plus the Z-11 for the QRPers). Likely to have special "Dayton pricing" on the OTT-100D and the LDG autotuners.

Unless you use the ATAS-100 or the FC-20 tuner with the FT-100D, using a tuner with this rig is not such a pleasant task. Also, you cannot use the CAT function when the FC-20 or ATAS-100 is used. With the W4RT Electronics FT-100D One-Touch Tune (OTT-100D), you retain the CAT functionality and can use both manual and autotuner with a constant carrier!

This OTT interfaces wonderfully with the LDG Electronics AT-11MP and their new RT-11 autotuners. All you have to do is just touch the TUNE button on these tuners and the tuning automatically happens. The OTT-100D will allow you to interface with many other autotuners (not the FC-20) and all manual tuners. For more information, please see www.w4rt.com and look in the Hardware section.

Hope to see you in Dayton.

Let me know if you get a good answer. Our CAT is completely out of control. Basically ignors any and all commands, even when sent multiple times. The only response is an occasional sonic emission (or worse).

No tuner. I haven't done a recent survey of each band, but I seem to remember being at 1:1.5 (one segement in the FT100D SWR meter) on every band but 40.

This is heavily dependant on the install of ATAS -- grounding, groundplane, mounting location, etc. -- same issues as with the hamstick.

Bill

The good techs at Yaesu told me that that is the only available
information. Personally I thought that it was pretty poor myself.

What platform are you programming for?

I have written a command line program and a gui front end for the
program to run under linux. The command line version will also
compile
for windows if you are using the cygwin compilier.

You can download the programs and source from
http://www.qsl.net/kc2ivl

# 13339. Copying Info from VX5R to FT-100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-02 18:08:49 UTC
From: shlstevens
Topic: 13339  Message: 13339

Hi folks,

I know there have been posts about programming the FT100D. But I'm not sure the solutions in the posts do what I'm looking for. Please let me know what I need to do the following:

I have a VX5R and I programme and maintain it using the ADMS software. Very clean, very nice. It allows me to manipulate all the settings. I'm looking for a similar programme for the FT-100D. I don't want to control the FT-100 from a computer, I just want to programme the memories and set the, uh, settings.

What is the best software (if it exists) to allow me to do this? And any suggestions for something similar for the 817?

Thank you kindly,
Scott

Hi Knut
and Hello friends!

What do you want to know ? Maybe i can help ? I startet also a new project for the FT-100 transceiver lately (After completing a project for the FT-847). I also did a search for undocumented CAT commands, but i found nothing. So the only base is still the manual ! It seems that YAESU's FT-817 is the only transceiver with a wide range of undocumented CAT commands.

I'm also very interested whether the cat command structure has been changed with the new FT-100D version, as i only have a FT-100 transceiver which i use to generate a program for. The start of a project for the FT-100 is a little difficult, because the command structure mentioned in the manual is wrong ! Please tell me your program status first, so maybe i can help...

From: Jim LeFevre
Topic: 13297  Message: 13344

Thanks for good suggestions, now that we have agreed on which part needs to come apart! I learned my lesson with my own atas100--it is clean and comes apart the way it should now. My friend's atas100, had never been removed since it was installed, let alone disassembled and cleaned, and after three winters in Michigan, it won't come apart. I'm not surprised. We are attempting to permeate the corrosion with WD40. We did try light impact as suggested, as well as heat from a heat gun, without any movement between the two pieces. His antenna worked flawlessly until it quit, and there was no more. So, first we will replace the $16 pc board. On my own atas100, when it failed, I found the motor bound up, and upon disassembly, the motor was severely corroded. The Michigan weather had entered around the bad o ring. So, first I replaced the motor at $39 only to find that the pc board was also bad. Which came first? I'm guessing that when the motor started to really load up just prior to locking up, it required more current than the circuit could supply. Also, I would not spray anything into the screw holes: two are dead-ended, but the third opens up to the interior of the coil assembly. Finally, I would make two points about the atas100 antenna. For its size, simplicity of use, cost and convenience, it is without rival when considering the whole package. And secondly, a little preventive maintenance goes a long way. My o ring did not do its job as it was twisted and abraded and allowed an entrance point for moisture (did I say that it happened to fail after driving for four hours at 70 mph in a heavy rain storm?). It is very simple to maintain the atas100. It is inevitable that all mechanical assemblies will fail and service life will always be extended with a proper maintenance program. Jim KB8UNU (whew!)

The FT100D doesn't appear to have a Clone command as do the FT817 and VX5 so
that seems to be a big problem with loading all the memories of the FT-100D
as you can with the other two.

From: Dick Thompson
Topic: 13348  Message: 13350

I guess you could call me prejudiced, Michael, but I am very happy with my new FT-100D. So far it has performed as advertised and although I was concerned about the high SWR issue and the fan issue, it hasn't posed a problem as yet. I have a couple of friends who have Yaesu FT-1000D's and they have commented that the 100D is a baby 1000D and found the receiver in the 100D to be comparable to the 1000D. Having never used or twisted the knobs on the 1000D I can only assume that they are correct. The 100D sold for over $4000.

One thing I have found to be irritating is the fact that Yaesu didn't put a ground lug on the back of the radio. I realize there are other options, but it would have been more convenient to have a place dedicated to grounding the radio. But it's not a big deal, just an inconvenience.

Would I buy another one? Unequivocally, yes! In a heartbeat! I have had reports of a slight raspiness (is that a word?) in the audio, but I attribute that to the grounding. Those that have given me the report said it wasn't something that they couldn't listen to, but they noticed it. Others have said it sounded just fine. Go figure! At this point in time, I'm going to be using the radio as a mobile unit on VHF/UHF and the HF capability is a plus. When I get the new ATAS-100 antenna system I'll tackle the grounding problem more aggressively.

My FT-100D was made in October, 2001 according to the serial number. The manual is one of the best I've seen from Yaesu. It's not perfect, but it's better than the manual (or as I refer to it, "brochure") that came with my new Yaesu FT-920, purchased in December, 2001.

I've come to the conclusion, after 40 years as a ham, that there is no "perfect" radio. They can all be problems in some form or another. I don't feel you would make a bad choice with either radio. I've always had good luck with Yaesu over the years. I've had good luck with Icom and Heathkits.

Good luck and I'd certainly be interested in knowing what you end up with.

73,

Dick

# 13352. Re: [FT100] FT-100D vs IC-706 MKII G

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-03 15:37:36 UTC
From: Pres Waterman
Topic: 13348  Message: 13352

One thing I have found to be irritating is the fact that Yaesu didn't put a ground lug on the back of the radio. I realize there are other options, but it would have been more convenient to have a place dedicated to grounding the radio. But it's not a big deal, just an inconvenience.

A ground lug can be approximated by buying, at a CB shop/truckstop, a set of knurled thumbscrews to replace the phillips screws that mount the mobile mounting bracket. You need 4mm ( 6mm length max- if too long, grind off or place a nut under the screw as a washer ).

If no luck, my local shop http://www.tandmelectronics.com has them for $1.25/2pk

The summary statement is that the FT-100D is the superior performer, especially the receiver, but it requires a minimum of two mods to make it right, and a maximum of three mods if one of them hasn't been done. There are many, many discussions about those mods in the archives. If you don't care about having the better receiver you can just go with the 706 and then you don't have to concern yourself with mods.

Michael,

I have both the Ft-100D and the IC706MkIIG --- and I like both rigs a lot!!!! I use the FT-100D in my Jeep because the Noise Blanker on the FT-100D is better than the Icom -- period!!! I use my Icom for a base (no space in my small house!) rig -- I think it is a litle more user friendly (no fights, guys, just a personal opinion!). I would buy either rig again!!

My only complaint using the FT-100D as a base unit is the fan noise.

Can you describe your opinion of each receiver. I chose the Yaesu
partly because I run CW a lot and it had the variable bandpass filter
DSP. Plus the overload spec was higher on the Yaesu. Just curious
how you compare the two receivers.

By the way, are you aware of the mic mod for the FT-100D? It makes a
big improvement in the transmit audio.

Did you notice that you'll have to opt out for each browser that you run?

"Note: This opt-out applies to a specific browser rather than a specific
user. Therefore you will have to opt-out separately from each computer or
browser that you use."

I used to think the Internet was a great idea. I'm beginning to see it as
highly efficient way for marketers to invade everyone's privacy instead.

May 01 is when Yaesu started doing the internal grounding that was missing in the earlier units. Lack of that grounding caused them to go into self oscillation and is the root of the complaints you hear about the earlier rigs. Radio K4IA Craig "Buck" Fredericksburg, Virginia USA QRP ARCI #2550 FISTS #6702 CC 788 Diamond #64 K1 #470 K2 #2460 fpQRP #442 QRP ARCI #2550 ---------- For cheap long distance, 800#s and more Tune to http://www.ld.net/?bucksavers 4.9 cents/min - no monthly fees [Non-text portions of this message have been removed]

If you go into the secondary F menus, hold the ABC keys in and turn the power on, then go into the secondary menus and look after the last standard menu you will find around the first F menu a value for the VHF RF gain or something similar. I think you'll find that if you lower this value the 2 meter RF preamp will stop oscillating, play around with this value but first note the original value for reference. I lowered mine about 25 % and then made some receiver DR test and even at the original setting and the 25% reduced setting I had no change in the Rx performance.

If she graduates from College I'll be too shocked to buy anything. Hi Hi. When she heard I had cancelled my dayton trip to see her graduate she called and said she was happy that I was going to see her graduate but felt badly that I cancelled my trip. I told her "good". Then I said I was only kidding. She's a sweet gal, but like most teens, in a world all her own.

Thanks for the answer to my question aboutmthe antenna.

73,

Dick

What I wnat to know is what are you going to get when she graduates
from college? :-) In reply to you question, if you use the ATAS-
100, you don't need a tuner.

Have fun!

The ATAS100 is great. Nothing easier to use. No, you do not need a tuner.

# 13368. high swr on 6 meter

Dear Group

I just get a 100D last week and I'm getting a high SWR reading on 6 meter.I try using a MFJ-6 meter tuner to tune it.I get it set right then when I key up again the SWR go up again.Then I reset the tuner and it happen again.And the tuner work good on a 847. Could someone help me please.

My antenna is a GP15

It sounds a you got oscillation in the FT100D.
Have you done "high/swr" mods on your radio ??

I had the problem myself on 6m.
Could not use my 6m antenna but when i switch to my 40m
antenna the rig worked ok. ( very lossy line on 6m = low SWR at the radio ).

So different antennaload can start or stop the oscillation.

/Mike SM3JLA

Yeah Chas,

I did the mic mod - it is an improvement!!! I also did
the fan and grounding mods, as well as making sure
every screw in the rig was properly tightened - the
FT100D is definitely a great rig!!!!

Topic: 13348  Message: 13372

You are an example of someone who simply takes care of business!
No whining, no denial, just action. Good job.
Yes, the rig is a winner. I get excellent audio reports on AM
operation too. The manual is devoid of any instructions for AM
operation. Maybe they don't want to admit that you MUST use the 6
kHz filter (a separate purchased option) to get proper AM operation.
Are you familiar with AM op with the FT-100D? It's this simple:
1) Set mic gain to 17 (that's seventeen). Or, if you want to use the
processor, enable PRO and set the level "within" the PRO button to 17.
(The PRO setting is nothing more than an alternate "mic gain" control
for processor enabled usage. There is no actual adjustment of the
percentage of compression available in the rig. You can prove this
to yourself by setting the mic gain to zero when you have the
processor enabled and set to some level above zero).
2) In AM mode go into the "F menu functions" and set F51 for 25 Watts
output, with an unmodulated carrier present.
3) If you want a bit more linearity (more obvious "upward modulation"
on an external power meter) then set F15 to about 165. Double check
me on "F15". I think that's the one. It's the HF output power
control in the F menu.

That's it. You will now get 100 Watts PEP AM and have the carrier
set exactly correct at 25 Watts output, unmodulated. The peak
envelope power of a 100% modulated AM signal is 4 times (6 dB) above
the unmodulated carrier power. The common mistakes made during AM
operation are setting the mic gain or "pro" gain too high and not
using the 6 kHz filter. I get excellent AM audio reports on HF.

The FT-100D is really a great performer. It just seems as though
they were in a rush to get the thing released to the market and as a
result a couple design bugs slipped through and the Users Manual
never got the polish it should have had. But we can learn here at
this bulletin board!

One more suggestion - buy headphones with an in-line volume control.
Then you can independently set the CW sidetone level for the speaker
using the internal VR004 potentiometer mounted next to the speaker
cable connector on the PC board, separate from setting the headphone
sidetone level using the in-line volume control.

73's and enjoy the rig!

Does anyone use a boom mike / headset for mobile use with the FT100D? If so what do you use and how does it perform. I know Heil make one specially for the Icom 706 but not sure if they have one set up for the FT100.

I want to buy one and would be interested in other users experiences first!

Topic: 13348  Message: 13375

When I installed it I partially pulled one of the several ribbon cables out of its PC mount connector. The result was the strangest sounding and behaving receiver I've ever heard. So watch the ribbon cables. It doesn't take much to unseat them. The whole installation is pretty delicate. You have to twist the board up to get to the filter mounting positions. On mine I had to cut one wire Yaesu had apparently added as part of some rework but I just re-did it after the board was laid back down. You should have no real trouble - it's just tedious.

From: backhoefade
Topic: 13376  Message: 13377

I read here that beginning about June 2001 Yaesu started shipping units with the spurious oscillation modification done (sometimes called the "SWR icon" mod). But I would be wary about going by the serial number since there isn't a 100% correlation between serial number and mod inclusion.

Also, the very latest units still lack the VHF/UHF fan mod. A quick "fan mod" fix is to add a resistor as described in many earlier postings.

The third mod is the "mic mod" which must be done by the buyer and isn't absolutely neccesary, but is essential if you want superb transmit audio reports.

# 13378. Re: high swr on 6 meter

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-04 18:35:47 UTC
From: backhoefade
Topic: 13368  Message: 13378

You likely need the spurious oscillation mod. The Yaesu repair
center will do it but you have to give up the rig for a couple months
(ask for the "spurious oscillation mod". Or you can try to do it
yourself using the information in the archives and "Photos" section
of this bulletin board but you run the risk of messing it up and
voiding the warranty. If you send it in you should also ask for
the "VHF/UHF fan mod" at the same time. Don't bother trading it in
for another one either as it's very likely that the next one will do
it too. Once the mods are done you will have a solid rig.
Good luck.

I don't know where you are located; there may be such a law there.

But in Ohio, they routinely grant driver's licenses to Deaf people. How many ambulances d'ye think a profoundly Deaf person hears? I heard the "no headphones while driving" thing while growing up here; I later became a police officer and found there was NOT any such law here (nor "no sandals," "no bare feet," etc.).

A'course, anybody can get a ticket anytime for driving unsafely or failing to yield to emergency vehicles, whatever may have caused it.

# 13380. FT100 Mic Mod

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-04 19:51:16 UTC
From: gavin AT
Topic: 13380  Message: 13380

Hi All,
Just in the process of doing the mic mod on my ft100,when i took it apart there is no plastic baffle just a small round felt pad held in place by a round rubber grommet also the two holes on the mic front are not there, just a small slit in the top right hand corner next to the lock switch.
The mic model is MH-42b and the radio was manufactured in July 1999, I have had the radio from new.
Would it be worth me leaving the felt pad and grommet out on reassembly in the hope of improving the audio.

Can't speak for a mic I'm not familiar with. You'll have to
experiment to see if it helps. Do you have a monitor receiver?
Try it on the air with the felt pad removed.

No, don't modify the MH-42. It is a beautiful sounding microphone. If you are using it, you should be getting very nice audio reports.

The MH-36 is the one that the people are modifying. The mod is only applicable to that microphone. It is the dtmf microphone which is supplied as standard with the radio in some countries. Here in Australia we have to buy it as an optional extra if we want it.

Happy ft100ing,
Alek. VK6APK

I just did the mod and my mic is the MH-36B. The plastic baffle was there and I took it out per the instructions. I punched through the plugged hole and put it back together. Works like a charm and my audio reports have been much better. Before I had reports of a raspiness. That seems to have gone away.

Subject: [FT100] Re: FT-100 early problems

I read here that beginning about June 2001 Yaesu started shipping units with the spurious oscillation modification done (sometimes called the "SWR icon" mod). But I would be wary about going by the serial number since there isn't a 100% correlation between serial number and mod inclusion.

Also, the very latest units still lack the VHF/UHF fan mod. A quick "fan mod" fix is to add a resistor as described in many earlier postings.

The third mod is the "mic mod" which must be done by the buyer and isn't absolutely neccesary, but is essential if you want superb transmit audio reports.

# 13387. Is this a cheap alternative to those expensive Heil headsets?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-05 01:38:07 UTC
From: yetbbwa
Topic: 13387  Message: 13387

Sorry if this was discussed at some other point - I did a few search in the archives and didn't see anything like I am about to mention. I was searching around for a good - affordable headset. I looked at the Heil Pro 5 - used for 100$ and thought - what a rip. And now, they don't even make them anymore. So, I started searching the web. I found several mics for DJing (Disc Jockeying) that look very suitable - and very close to the same as the heil. Some brands were Stanton Magnetics, NuMark and Gemini.

I haven't tried any of these yet, so I can't attest to their usablility:

Heil Pro 5 alternative:

http://www.stantonmagnetics.com/stingray/hp_djpro500mc.asp

Heil Pro Set 5 alternative (check that price!)

http://www.competitionsound.com/d200m.html
http://www.pricesrite.com/em400.html

I figure for the microphone response - you could always adjust the mic setting on the radio or change the carrier point to get an acceptable sound for what you are trying to use it for. Or - you could always probably fit an actual Heil end onto one of these mics. Perhaps you would need to add some type of RF filtering too - but - they look like a mighty good alternative to me and the prices can't be beat!

Hope this was useful.

Scott McClements.

One thing I have found to be irritating is the fact that Yaesu didn't put a ground lug on the back of the radio. I realize there are other options, but it would have been more convenient to have a place dedicated to grounding the radio. But it's not a big deal, just an inconvenience.

A ground lug can be approximated by buying, at a CB shop/truckstop, a set of knurled thumbscrews to replace the phillips screws that mount the mobile mounting bracket. You need 4mm ( 6mm length max- if too long, grind off or place a nut under the screw as a washer ).

If no luck, my local shop http://www.tandmelectronics.com has them for $1.25/2pk

Terrible website. But for a hole-in-the-wall local alternative to Radio Shack they have some surprising stuff. Today, I picked up a special mount for the ATAS-100 on my new Mustang Convertable, the one with the thick fiberglas hood and trunk. Just think about that for a minute...

After half an hour of us scratching both our brains he came up with an old bracket mount that mounts inside the trunk, and folds around and makes some sort of shelf that sticks out of the trunk. What I needed was something that I can screw into the
shock tower and sticks out of the hood... or trunk, whatever.

He had it. DUSTY! 1976 vintage product. At $10 I liked it better than the $65 Comet fold-away mount.

We'll see.

Well, I'll be looking for a mount for my F-250 pickemup and my Buick Regal.

How tall is the ATAS-100? There is a plug in the roof of the pickup where an antenna was once installed. It would be a good place to mount it, but darned if I want to hit something low and break it off.

From the FAQ section at:

http://k0lee.com/ft100faq.html#atas

"The ATAS antenna is 56" fully retracted and 63.5"
fully extended. A trunk lip mount like the Diamond
K400 adds about 2" to the overall height. The whip
portion of the antenna extends 35.5" above the base
and the whip is 2 mm (.080") in diameter."

# 13397. Re: [FT100] FT-100D vs IC-706 MKII G

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-05 15:18:36 UTC
From: Dick Thompson
Topic: 13348  Message: 13397

Thanks again, Lee.

I need to look at the different mounts available. I am presently using a Hamstick mounted on the mirror on the drivers side of my pickup, but it is really high. Too high in fact. I also need to have an antenna that I can put on my family car without drilling any holes or messing up the paint job.

73,

Dick

> How tall is the ATAS-100?

>From the FAQ section at:

http://k0lee.com/ft100faq.html#atas

"The ATAS antenna is 56" fully retracted and 63.5"
fully extended. A trunk lip mount like the Diamond
K400 adds about 2" to the overall height. The whip
portion of the antenna extends 35.5" above the base
and the whip is 2 mm (.080") in diameter."

From: Mike May
Topic: 13346  Message: 13399

Looks like you have a new swarm of birdiies in your radio, just kidding try tuning around 148.15 MHz(+- several KHz) and see if your radio has a loud one around there. If not then maybe your synthesizer is tuned differently from other radios. A lot of us have reported spurs about 148.15 +- several KHz and if you don't have oneclose to this frequency in your radio then maybe Yaesu has moved the spur frequencies around since there were several who complained about it being on the CAP frequency.

I've never had to use grounding at the rig in any base or mobile application. Since having the spurious oscillation mod done I've never had a problem developing full power in any installation. Never need grounding at the rig other than the DC return line back to the battery. Yaesu obviously didn't expect to have to have the rig grounded or they would have provided a connection for it.

Topic: 13348  Message: 13401

That's an interesting theory, Chas. All I've seen about mobiling with the FT-100D is 'Ground, ground, ground." Now you're tossing out a whole different thought. Is this a test? :)

You know, I ran a 70 watt Kenwood 2 meter rig in vehicles for about 20 years. I never had anymore grounding than the return to the negative side of the battery. Also, I never had any problems. Any kind of ground wouldn't hurt things, but I find your comment interesting.

73,

Dick

Presumably this is the same Yaesu that didn't expect

the rig PA to oscillate (and self destruct) before the mods were done;
(It happened to me)
have the VHF/UHF PA blow up before additional cooling was fitted; (It
happened to me and was expensive!)
require holes to be added to the microphone to get decent audio (ok this
one is emotive)?

# 13403. A "groundless" arguement

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-05 21:26:35 UTC
From: backhoefade
Topic: 13348  Message: 13403

I knew this would stir up some good discussion.

Here's my "groundless" arguement:

My point is simply this. Do not confuse what you might call "traditional" station grounding practices with grounding that is added in order to suppress or eliminate an internal spurious oscillation design flaw. Quite frankly, from the standpoint of antenna feedpoint impedance control, the addition of an "earth" or vehicle chassis ground at the exciter has zero effect on matters. At least it shouldn't. The feedpoint impedance is solely established by the physics of the radiating element(s) and, in the case of a "counterpoised" antenna, appropriate grounding at the antenna feedpoint and sufficient ground plane area (natural or man-made) in the vicinity of the antenna. Grounding at the exciter (the FT-100D under your dashboard for example) only provides a safety measure in terms of providing a conduction path in the event that the antenna system incurs a high voltage input (eg. lightning strike). The grounding at the rig is so distant from the antenna in terms of inductive (and possibly resistive) isolation that such ground will have virtually no impact on feedpoint impedance at the antenna itself. If you have a high SWR situation, that's an anomalous situation and you may influence the effective SWR at the rig's output port, but as I said, that's an anomalous case.

In general, a radio should never, ever emit a spurious oscillation at some arbitrary, unintended frequency, regardless of how whacko the load is that it's looking into. In the case of what appears to have been about 20% of FT-100Ds, these boxes would put out a spurious signal at about 13.65 MHz regardless of how perfect the load was at either 24 or 28 MHz. Some people found that adding external grounding here and there would sometimes eliminate the spurious oscillation but that extra grounding should not be required. The rig should operate, without spurious outputs , while sitting on an insulated table, connected to a independant 12 Volt car battery next to it, with its antenna connector connected to an arbitrary length of coax to any reasonable 50 ohm, resistive/partially reactive load, as long as the mismatch at the antenna feedpoint results in an SWR less than about 2 to 1, where the SWR fold-back circuit appropriately kicks in.

I really like my FT-100D. But I'm not going to kid myself into thinking that a bunch of external grounding should be neccessary in order to operate it without having spurious oscillations occur. A fair percentage of them had the bug and the proper remedy is the internal modification.

End of "groundless" discussion. Time to enjoy the rig.

# 13404. Re: [FT100] A "groundless" arguement

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-05 22:05:08 UTC
From: John McClain
Topic: 13348  Message: 13404

I am curious what you base your 20% estimate on. I have never seen
any numbers published by anyone as to the number of units produced
verses the number of units that fail. Reading your message has given
me a great idea. Since I can't enjoy my rig because I am afraid to
turn it on, I will add a second antenna that is tuned to 13.65MHZ in
parallel
with the normal antenna. This way when the rig decides to start
oscillating on its on, it won't see a high SWR and self-distruct.
Da-da, problem fixed!

John
K7SVV@...

Hi. As a car dealer/Amateur Radio operator, I have some unique insight into the challenges of getting a FT-100 and ATAS-100 working in many different vehicles, so I would like to share speedbumps and freeways when I come across them.

This month's challenge to mounting the ATAS-100 is a 2002 mineral-grey black-top leather seats Mustang Convertible. ( Yes, I look good driving it. Approximately 4.5 dB improvement in my looks when in the car ). Problem is they now have changed to fiberglas ( fabric on the roof of course ) on virtually all horizontal surfaces. What to do?

Forget Radio Shack. They have nothing I need for this. Universal Radio ( http://www.rffun.com ) quoted me over $60 for a Comet or Diamond fold-over mount. So I went to the local hole-in-the-wall http://www.tandmelectronics.com who has many obscure things, all very dusty. After some considerable head-scratching and blank stares I finally asked him if he has any sheet-metal. I was going to duplicate an old mount idea. He came up with a vintage 1976 fold-away inside-trunk CB mount for $10. I will try to draw it when viewed from behind, on the left side of the car:

```
__<---- antenna mounts on this horizontal pre-drilled SO-239 sized hole
|__<---------- trunk closes over this horizontal surface
_ |
|__|
<== hinge... ( I removed the hinge and the stuff on the left that
curls up )
```

It's supposed to be screwed UP into the underside of the trunk, and it flip-flops down into the trunk. "Don't tip-off the rip-offs" ( I told you it was from the '70's )

So, I was now left with this "Z" bracket

```
__
|__
|
|
|
```

so I have this mounted to the vertical side surface inside the engine compartment. The hood closes and the bracket sticks out a little.

```
ATAS-100 goes here
\/
__
| _____________HOOD
|__
```

|<- screwed
|
|<- screwed into car ( GOOD ground!!! )

As an aside, Ford seems to have gone back to a centralized coil-pack, not having a coil on each spark plug. Since this pack was so close to the antenna mount, I decided to ground the coax shield directly to the coil-pack mount. I don't know if this hurts or helps ( my thought was maybe by putting the pulses directly on the shield it might somehow cancel the pops in the antenna??? Wishful, I know )

There is gummy tape between the mount and the paint, as I expect the flexing antenna will wear into the paint otherwise.

Performance? 40m check, 30m check, 20m check, 17m check, 15m check, 12m check, 10m check, 10m check, 6m check! Good SWR, no RF pollution flashing display in TX ( that developed in the Escape mysteriously after a few weeks ), no stalling engine when TX. Ignition noise... not so bad! 40m none, 30m some, 20m good, 15m good, 10mFM still S8 ( arrgh ), these are very preliminary reports mind you, but seems good.

Transceiver is mounted vertically in front of the very small ( kids fit perfect ) rear seat. Control head as I usually do, behind the driver's sun visor.

2m and 440 antenna is mag-mounted to the steel panel where it briefly turns horizontal next to the trunk. Thinking of going to a Larsen glass-mount up high on the windshield.

Thanks

# 13407. RE: [FT100] A "groundless" arguement

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-05 22:32:03 UTC
From: Cliff Bryant
Topic: 13348  Message: 13407

Hi Chas

Great discussion indeed...

You are perfectly correct about an earth not being required at the exciter output (in theory). This does assume that no rf current is present in the negative of the system. The addition of an earth at the exciter has no bearing on the actual rf output to the load. In a fixed station the addition of ground tags is to allow all units to be bonded to a common star earth point mainly for safety, assuming we are feeding a balanced aerial of course.

Since in an automotive installation the aerial is being driven against a ground it is essential that a good ground to the chassis is provided at the aerial mount... just as you said. However if the negative of the radio is connected directly to the negative of the battery (via the power wire) then the rig can effectly float if RF gets into the negative of the system. If however you bond the negative of the radio to the chassis and the earth of the feedpoint to the chassis then since both ends of the coax are grounded this will not affect the feedline. It will however clamp the radio and the antenna to the same earth (assuming the car body is a massively metal of course). There is a sting in the tail. If you do the above then the negative of the radio is in the same circuit as the starter motor (and all other negatives of the car) since the battery negative is grounded to the chassis via a thick cable and all other circuits use the chassis for the negative. If you bond the radio negative to the chassis and connect the battery negative to the radio you will reduce the above effect but it's not ideal. Basically bonding as much of the negative to the chassis has held me in good stead over the years. These radios are not unconditionally stable - not surprising. The best solution is a separate battery of course.

My points were slightly tongue in cheek to emphasize that the word 'design' or maybe the phrase 'quality control' might be loosely applied in the case of the FT100 or my units at least. You are perfectly correct about the (lack of) grounding of the radio being nothing to do with output grounding but the fact is my radio (an early FT100) suffered all of the ailments (it would seem) due to poor design. I still like the radio and would agree with comments about the noise blanker - it's the best I've ever had in a mobile.
I am not however disposed to buying a small Yaesu mobile again although I do have a number of their hand held radios.

Sorry about the long 'over'

Cliff, G4PZK

I knew this would stir up some good discussion.

Here's my "groundless" arguement:

My point is simply this. Do not confuse what you might
call "traditional" station grounding practices with grounding that is
added in order to suppress or eliminate an internal spurious
oscillation design flaw. Quite frankly, from the standpoint of
antenna feedpoint impedance control, the addition of an "earth" or
vehicle chassis ground at the exciter has zero effect on matters. At
least it shouldn't. The feedpoint impedance is solely established by
the physics of the radiating element(s) and, in the case of
a "counterpoised" antenna, appropriate grounding at the antenna
feedpoint and sufficient ground plane area (natural or man-made) in
the vicinity of the antenna. Grounding at the exciter (the FT-100D
under your dashboard for example) only provides a safety measure in
terms of providing a conduction path in the event that the antenna
system incurs a high voltage input (eg. lightning strike). The
grounding at the rig is so distant from the antenna in terms of
inductive (and possibly resistive) isolation that such ground will
have virtually no impact on feedpoint impedance at the antenna
itself. If you have a high SWR situation, that's an anomalous
situation and you may influence the effective SWR at the rig's output
port, but as I said, that's an anomalous case.

In general, a radio should never, ever emit a spurious oscillation at
some arbitrary, unintended frequency, regardless of how whacko the
load is that it's looking into. In the case of what appears to have
been about 20% of FT-100Ds, these boxes would put out a spurious
signal at about 13.65 MHz regardless of how perfect the load was at
either 24 or 28 MHz. Some people found that adding external
grounding here and there would sometimes eliminate the spurious
oscillation but that extra grounding should not be required. The rig
should operate, without spurious outputs , while sitting on an
insulated table, connected to a independant 12 Volt car battery next
to it, with its antenna connector connected to an arbitrary length of
coax to any reasonable 50 ohm, resistive/partially reactive load, as
long as the mismatch at the antenna feedpoint results in an SWR less
than about 2 to 1, where the SWR fold-back circuit appropriately
kicks in.

I really like my FT-100D. But I'm not going to kid myself into
thinking that a bunch of external grounding should be neccessary in
order to operate it without having spurious oscillations occur. A
fair percentage of them had the bug and the proper remedy is the
internal modification.

End of "groundless" discussion. Time to enjoy the rig.

N6AF Chas

That's a great idea! I think there's a spot waiting for you in the Marketing/Sales dept!

You can also claim that your transmitter has frequency diversity path protection. In the event that multi-path effects cause a deep cancellation null at your normal operating frequency, you may stand a good chance that the multi-path geometry is not causing the same degree of fading at 13.65 MHz. Problem is that there will be about 5,000 other hams "enjoying" the same alternate 13.65 MHz frequency. Oh well, it seemed like a good idea.

Anyway, the 20% number comes from the mini-poll that exists right at this bulletin board. Go take a look. Unfortunately my vote was one of the "had the problem, but fixed it" ones.

No, that means "of all those who chose to report a ( or multiple ) problem, 20% of those problems were of <description> type. It does not mean 20% of the radios out there suffer from <description of problem>.

There is a similar poll going on FT817@yahoogroups.com

It basically asks: "Manufacturer defects I have faced are...:"

Inlcuding the answer "NONE" ( which is about 75% of the respondants, who should actually not respond at all ) there are just over a hundred responses.

So, of 3,000+ members, about 30 reported problems, and 90 had none.

Someone incorrectly surmised that 25% ( 100%-25% ) of the radios made have problems. In reality it is 0.98% of the group of owners on that mailinglist have problems of some sort.

Thanks

The good techs at Yaesu told me that that is the only available information. Personally I thought that it was pretty poor myself.

What platform are you programming for?

I have written a command line program and a gui front end for the program to run under linux. The command line version will also compile
for windows if you are using the cygwin compilier.

You can download the programs and source from
http://www.qsl.net/kc2ivl

Even simpler, just put on a decent sized dummy load and it will have NO SWR problems no matter what frequency it is on! :-))

Subject: Re: [FT100] A "groundless" arguement

I am curious what you base your 20% estimate on. I have never seen
any numbers published by anyone as to the number of units produced
verses the number of units that fail. Reading your message has given
me a great idea. Since I can't enjoy my rig because I am afraid to
turn it on, I will add a second antenna that is tuned to 13.65MHZ in
parallel
with the normal antenna. This way when the rig decides to start
oscillating on its on, it won't see a high SWR and self-distruct.
Da-da, problem fixed!

John
K7SVV@...

>In the case of what appears to have been about 20% of FT-100Ds, these
>boxes would put out a spurious signal at about 13.65 MHz regardless
>>of how perfect the load was at either 24 or 28 MHz.

Thanks, Pres. I see what you're doing. I'll bet you got one helluva deal on the Mustang. :)

Yes, but I do all this customization, and the bums sell it next week!

Thanks

# 13415. Ant Err message

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-06 02:41:54 UTC
From: Dale G. Brown
Topic: 13415  Message: 13415

I just unhooked my FT100 from the car and removed the separation kit to try to find the source of "bad audio" reports that I received recently on 10 mtrs. Upon installing the faceplate and hooking up the power and beam in the shack, I made a contact with Italy, on 17 mtrs, with 59 report and great audio. I then straightened all the wire in the car and reinstalled the face plate. When I try to tune the ATAS100 on any band, I get an immediate "Ant Err" on the display and the tuning stops. I had the menu 61 on ATAS-1 for a few seconds until I remembered it was supposed to be ATAS-2 for separate UHF/HF antennas. Is my ATAS100 fried? Dale KC2PZ

# 13416. Re: [FT100] another success story

Ant err probably means the antenna is drawing too much or not enough
cuurent. Check the RF cable and the mount... you would be surprised at how
center pins and conductors break, grounds dissolve, things like that.

Start with applying 12v to the coax ( without the radio connected of
course ) and see that the antenna extends. Try 8 or 6v and see if it
retracts. That's the basics to check.

Thanks

Dale, I would certainly hope it isn't "fried" over such a little mistake. My manual says to use ATAS-2 if you are using 2 separate antennas for 144/70cm and the ATAS-100. If you're using a Diplexer then it should be set to ATAS-1. I assume you already know that.

Let us know what the results are.

# 13426. Re: [FT100] Adapting the Radio Shack FIVE DOLLAR Simplex Repater to mobile use

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-06 17:20:56 UTC
From: aluscre
Topic: 12175  Message: 13426

Does anyone have a surplus unit they would like to part with or have a local Radio Shack with item in stock?

Pres Waterman wrote:

# 13427. replacement whip for atas 100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-06 16:56:19 UTC
From: we1md
Topic: 13427  Message: 13427

Can anone get me the RS part # for a whip that will work on ATAS100
Vertex says perhaps in 6 weeks!

# 13428. FT100 with a power supply question

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-06 14:44:19 UTC
From: tdc455
Topic: 13428  Message: 13428

Greetings all,
I currently use my FT-100 and FC-20 indoors as a base. Power is supplied by a Astron RS-50M. I noticed a few weeks ago that when I first power up the P/S a relay or something clicks inside the FT-100. The display very briefly flashes as does the power led on the tuner. Has anyone else notice this. Is this something to be concerned about? Is this surge doing any damage? I see no way of preventing it short of disconnecting the power cable prior to bringing up the P/S.
Thanks,

Tim W9TDC

Go to www.mods.dk
You will find a lot of good stuff there including the ARRL review in pdf format. click on Yaesu and then manuals. The site contains so much good information you will probably add it to you favourites listing.

Hello to all,

looking for the QST-Review of the FT-100/FT-100D in .pdf format.
Anybody know a link?

Any help is appreciated!

You are absolutely correct; the percentage could very well be more than 20%. By the way, I went back to the poll at this site and the total percentage reporting the "SWR icon" problem is about 39%. Who cares-if it has the bug you get it fixed. End of story.

--- In FT100@y..., Pres Waterman <presw@1...> wrote:

No, that means "of all those who chose to report a ( or multiple ) problem,
20% of those problems were of <description> type. It does not mean
20% of the radios out there suffer from <description of problem>.

Hi group,
sorry to the few group members who emailed me when I was in Reno NV, as I was travelling all over the western States with not much time in any 1 place to meet people.
Well I have just returned home from the States from a very enjoyable 8 week visit and with a 40m metre dipole erected and a high QTH ;), I put the FT-100D through it's paces. What can I say that many of you guy's already know, this is 1 neat little rig. I was mainly operating on 10 and 15 metres as well as S/W receiving all over the HF spectrum during the 8 weeks and the 2 contests, and the radio's front end is what I can say "pretty much bullet proof". The only time I heard some splatter is during the 2 contests when some op's where driving their rigs hard, which I suppose is to keep over stations away from their frequency.
On many contacts I received strong and excellent audio reports and during the 8 weeks of operating, the radio performed trouble free and impressive. While over in the States I purchased a Kenwood PS-40 23amp switching power supply which handled the 100 watts with ease, a 6khz AM filter which I found to be a much needed item for S/W and AM VHF airband receiving, a FT-100D service manual and a NCG 1000C dualband mobile antenna.
Also when using the radios DSP I found the 'DNF' notch filter to work but it was just not deep enough to get rid of the squeals. Plus when there where some loud hetrodynes I used the 'DBP' (HPF/LPF) to help elimnate the squeals. As well I found the 'DNR' noise reduction to very much help with static crashes and QRN, and the 'DBP' bandpass filters to narrow up the passband.
I might be returning in June or July and I hope to contact alot of you FT-100 owners on 15 or 10 metres.
73, VK2NEW Anthony.
Richy N2ZD how are you going. I listened out on 17 metres for you but no luck. I heard alot of the HF pack group operating QRP with the FT-817 or the K1/2's. How is your TS-2000 going and have you got another FT-100.

# 13434. FT-100/ATAS-100 Install

Yahoo group: FT100 (2002-01 — 2002-06)

Topic: 13434  Message: 13434

Hi Group!

This comes under the "For what it's worth" catagory. I just installed an ATAS-100 on my Ford Explorer and had a few grounding problems but worked them out and I thought I would share the results/solution with the group.

I moumted the FT-100 in the back and used the remote mounting kit with the display head on the dash over the console. I used a Diamond K-400 mount on the top left (driver's side) of the back hatch. On the first test it worked great on 20 & 40. Would not auto tune on 10, 15, or 6 meters. There is so much stressed about proper grounding I felt that may be my problem.

Today I removed the K-400 and used a Dremel tool to grind the paint off the inside of the hatch door where the allen screws from the mount contact the car. Then I had a scrap piece of 1" ground braid so I made a short 3" strap and strapped around one of the top hinges to assure the door was grounded to the rest of the body. On the first test it auto tuned great on 10 & 6 meters. It still won't auto tune on 15m but manual tunes just fine. I then tried it on the WARC bands and it manuals tunes and works great on 12 & 17. I'm a happy camper! Just thought I would pass it along....

Put a UHF "T" in the feedline and then measure the voltage on the center pin of the "T" with a voltmeter in series with a 200uH coil. You should measure about 10 volts or so going up and 8 volts or so going down. If not make sure the correct menu selection is still in memory, if there is wild fluctuations then there is a problem internal to the radio in the regulator circuit for antenna motor control.

Mike: I tried the "T" connector and there is no change in voltage. The "ant err" message happens right away after you push the tun button. The same message appears after changing menu 61. When you hit the function button to return to operation, the display shows the dreaded "ant err". I wonder if the auto tune control chip is "kafooy"? I looked at the schematic with a magnifying glass, but could not tell which chip does this. Dale KC2PZ portable 5

From: k5unm
Topic: 13415  Message: 13438

The antenna control voltage is derived from Q7018 (PQ20VZ1U) which is controlled by Q7026 a vanilla 2904 quad op-amp which is directly controlled by Q7010 the CNTL-UNIT uP (UPD7BP403BGC-BBT). In all probability you need to send the rig back to YASEU at their new address ( they moved from Cerritos on the first of this month) unless you are capable of doing SMT repair and have the SMT components. The regulator Q7018 can source upto 1 amp with infinite heatsink according to the SHARP data sheet. All this circuitry is on the CNTL-UNIT pc board of the radio.

Hope this gives you the insight as to where the voltage is created and how. It is routed through several boards to get to the LPF unit where it is injected into the RF output.

Dick,
Nope the volts jump up to about 13.6 and the amps stay between 0 and 1 unless I key the up a transmitter. All looks normal there. This may have existed since day one and I've just never noticed it. The P/S is usually left on all the time as one radio or another is usually monitoring. I can't tell you if this occurs mobile. I have never installed this rig mobile. I'm hoping it's nothing to be worried about.

Subject: [FT100] FT100 with a power supply question

Greetings all,
I currently use my FT-100 and FC-20 indoors as a base. Power is supplied by a Astron RS-50M. I noticed a few weeks ago that when I first power up the P/S a relay or something clicks inside the FT-100. The display very briefly flashes as does the power led on the tuner. Has anyone else notice this. Is this something to be concerned about? Is this surge doing any damage? I see no way of preventing it short of disconnecting the power cable prior to bringing up the P/S.
Thanks,

Tim W9TDC

This is normal...at least, mine has done this from when I first got it, almost two years ago. I assume everyone's does (if they listen close enough.)

It may not be a problem. I have noticed when I plug the power cord from the power supply into the pigtail on the back of the rig, and the radio is OFF, I can hear a slight click like a relay or something.

It may be that you don't have a problem at all, Tim. I'm sure there will be other responses to your question.

# 13442. Moving Memories around

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-07 04:59:42 UTC
From: Tom Tishken KD4WOV
Topic: 13428  Message: 13442

Hello everyone,
I have 250+ memories stored on my FT-100D. What do you all recommend for moving memories around easily. I have found a streamlined approach for the front panel, but was wondering about soft ware for manipulation the memories.

go to memory (lets say 20) 20 then select M>V. Then select vfo/mr. then hold in V/M for about a second you will hear a beep (this erases the memory). Then select vfo/mr. Then select V/M and find a new memory location. then hold V/M for a second and now you have completed your memory move.

# 13443. Re: [FT100] FT-100/ATAS-100 Install

AFAIK, there is no way to directly manipulate the FT100 memory channels thru external software, as there are no commands to do so. There MAY be some undocumented commands to do this, I just have not found any reference to it.

My approach to this task in my software, is to use a seperate datafile for memory channels. This way I have many more available to me than the 300 that are provided by the FT100.

If I were to chaange memory channels on the FT100, I would load my software, and the external datafile, then manually add them to the FT100 internal memories. To add them to my external file, I would need ttdo the opposite.

If you are running Linux, my software is at http://www.qsl.net/kc2ivl
There is a windows version available (command line only), and the tasks outlined above are actually functions of the gui frone end, and I have not written one for windows at this time.

Here in Australia, the warranty on the radio is 2 years with free shipping for repairs. The actual repairs are warranted for 12 months.

So, if your radio breaks at 23 months of age, you send it to the service department and they pick up the tab. They fix the fault and if that same fault should return within 12 months it will once again be repaired free of charge. Should any other fault which is not related to the previous repairs occur, then of course you would have to pay all the costs.

Pretty good hey? Once again, that is the reason we pay more for our radios up front.

Happy ft100ing,
Alek. VK6APK

# 13447. FT100D Mods

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-07 15:33:47 UTC
From: Alex Turner
Topic: 13447  Message: 13447

I decided to open my rig up this morning and get the mod situation resolved.
S/N 1L280356

The fan mod has not been done.

In comparing the pictures from the different internet sources to my rig there is a very big difference. First off there is no foil tape. There is a healthy copper strap running from the coax at J5014 to the coax at J1003 and on the way across the frame divider it is clipped,not screwed to the frame. Does it sound as if the mod for the SWR has been installed?

I am going to do the fan mod and the mic mod before closing it up. If anyone would like for me to supply pictures I can. I appologize if this is old news to some of you.
BTW, I was able to load up on 6 into a dummy.

# 13450. Re: FT100D Mods

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-07 19:10:40 UTC
From: vk2new
Topic: 13447  Message: 13450

Hi Alex,
it seems that the Yaesu service centres in VK and W land are using copper clips to rectify the grounding problems. My FT-100D has 2 clips attached to the chassis with braid solderd to the 2 internal coax connectors and I can say that I have not yet had any problems what so ever.
With the fan mod, I added a 1 watt 39 ohm "I think" resistor to the black lead in the connector of the fans, so the fans will run at a slow speed to keep the radio happy.
So all in all it looks like the SWR mod has been performed on your radio and the fan mod is still to be done. You might concider doing the fan mod your self becuse it is very easy and it will save you time in sending the radio in to Yaesu.

73, VK2NEW Anthony.

No its actually helpful.. Add in the fan mod and mod the mic and
you are done.. Yaesu's latest fix by clipping the ground to the rib
seems to make it stable so if you are not having any problems leave
it be.. Regards.. Richy N2ZD

# 13455. Re: FT-100/ATAS-100 Install

From: ft100guy
Topic: 13434  Message: 13455

Make sure you have two grounds from the rig to the chassis and coil a few turns of the HF coax under the ATAS (in the trunk is fine also) and secure with ties (try different amounts of coax loops until it tunes 15m..) By far the most important thing to your ATAS is the the ground right at the mount, very critical in some installs to get it to work right if its not properly done. Regards.. Richy N2ZD

PS sometimes you can trim the coax to get a match on a band that is not tuning properly.. Also add a ground strap from the atas to the lid, you should be able to sandwich one between the coax connector if you cant do it from the mount itself..

>
> I moumted the FT-100 in the back and used the remote mounting kit with the display head on the dash over the console. I used a Diamond K-400 mount on the top left (driver's side) of the back hatch. On the first test it worked great on 20 & 40. Would not auto tune on 10, 15, or 6 meters. There is so much stressed about proper grounding I felt that may be my problem.
>
> Today I removed the K-400 and used a Dremel tool to grind the paint off the inside of the hatch door where the allen screws from the mount contact the car. Then I had a scrap piece of 1" ground braid so I made a short 3" strap and strapped around one of the top hinges to assure the door was grounded to the rest of the body. On the first test it auto tuned great on 10 & 6 meters. It still won't auto tune on 15m but manual tunes just fine. I then tried it on the WARC bands and it manuals tunes and works great on 12 & 17. I'm a happy camper! Just thought I would pass it along....

# 13456. Antenna/Gnd help needed for new (clueless) General

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-07 19:36:40 UTC
From: Roy7654321
Topic: 13456  Message: 13456

Hi. I just passed my General tix yesterday, so now I went from a clueless Tech to a clueless General. <smile>

I am currently away from home so could use some help in getting my new FT-100D running from a 2nd floor apartment with poor antenna space or ground. :(

GROUND - can I ground to the center of an electrical outlet? OR, would something like the MFJ Artifical Ground do the job for me?

ANTENNA - I am looking at something like the MFJ Portable Antenna 1621 or the MFJ Apartment Antenna 1622. Do I need an Antenna Tuner for either antenna (I don't own an antenna tuner or SWR meter yet). If I need an antenna tuner, would an MFJ 941 or 949 do? (I'm not sure of the advantage of one over another).

Thanks - Roy Ashkenaz K2RMA

Dale -

What happens with the ATAS disconnected from the rig?

The err message shows up when the rig tries to TUN with a dc short on the HF/6m output. The motor drive circuit is based on a voltage regulator chip that current-limits itself, so it's supposed to survive normal accidents.

How's the pigtail holding up?

(BTW, ATAS-1 vs ATAS-2 is harmless, it simply affects whether the TUN button starts a timed retract cycle on 2/440).

Roy, The best thing that I have found for finding ground for the radio is to make one radial each for each band that you want to operate on. If you want 40 32' 6", 20 is 16' 6', 15 is 11', 10 is 8' 3". these are made from insulated wire, since they will have some voltage on them, and all tied to your rig ground at one end. The wire size is based on what is available and what you want to wind up sometime. They can be bundled together and run around the perimeter of the room if you want. They will effectively strip the RF from the radio. I have used this from a 17th floor motel room without problems when the antenna was a vertical less than 15 feet away. You are no longer clueless, you now know what a quarter wave is on those bands.
The antenna is another matter. You can run one inside the room, but will have better results with it outside. If the window opens or there is a balcony you are in luck. I use a mp1 from superantennas.com, and HRO is selling it for him also. I have used this from numerous hotel rooms with good results. It comes with a "c" clamp to attach the bracket to a balcony rail and some of it's own radials. Verticals like this work the best if they are center loaded. This comes with rods to put the coil in the middle. Amateurs have antenna opinions, so I am sticking to what has worked for me.
I have used another arrangement that had a coil at the base and a collapsible rod, the coil was changed per band, did not work well.
The 1620 is similar to hamsticks, and iron horse and others that work well on the car, will need radials and a mount for your apartment. I have used two of these as a dipole with a mount available and they work well, if you can get them away from the building and elevated.
There is an old book out there that I have seen at some radio shacks, "simple low cost wire antennas for radio amateurs" originally by W6SAI and W2LX. good book to have and experiment with.
A tuner will be a necessity, I use an old MFJ that is quite similar to the 941 of today. The 941 is 12 steps of inductance and a capacitor in and out. The 949 adds a dummy load in the box to tune on. Both of them have multiple antenna positions to connect to. The 945e is just a simple tuner with no multiple antenna positions to connect but no bypass switch. I have been looking at the 945e for the car and the portable suitcase. What you do not want is some of the older ones that use a ferrite coil, the loss is higher.

Alex,

If you are using the MH-36B mic, you will need to remove the mike element that is surrounded by rubber from the plastic tube. Use a small pointed instrument (a dental pick is ideal) and carefully lift the element out of the plastic tube. The element will NOT separate from the rubber. After you get the element and rubber surrounding it from the plastic tube, shake the mic upside down and remove the plastic baffle (the same size as the diameter of the inside of the plastic tube). Then, look through the plastic tube and you will see that only 2 of the 3 mic holes are open. Use a sewing needle and poke through the one that is plugged up. Set you mic gain to 55 and you will find that your audio reports will be much better.

Good luck.

73,

Dick

Date: 2002-04-08 02:39:02 UTC
From: Tom Tishken KD4WOV
Topic: 13428  Message: 13465

could the software be used to read or write a VFO freq? If so you do it a long way round use the M>V key, then load the freq into your software. Manipulate your freq (add mode, RPT shift, TON, SKP. and others) for each channel then reorganize the Freq list, and write the memories one by one. Or is that too complicated to do the limited capabilities of the FT-100 Cat port?

AFAIK, there is no way to directly manipulate the FT100 memory channels thru external software, as there are no commands to do so. There MAY be some undocumented commands to do this, I just have not found any reference to it.

My approach to this task in my software, is to use a seperate datafile for memory channels. This way I have many more available to me than the 300 that are provided by the FT100.

If I were to chaange memory channels on the FT100, I would load my software, and the external datafile, then manually add them to the FT100 internal memories. To add them to my external file, I would need ttdo the opposite.

If you are running Linux, my software is at http://www.qsl.net/kc2ivl There is a windows version available (command line only), and the tasks outlined above are actually functions of the gui frone end, and I have not written one for windows at this time.

Or
> is that too complicated to do the limited capabilities of the FT-100 Cat
> port?

The best way to compromise the memory issue would be to have the software ready to present to the VFO each full channel data incl.mode, tone, offset I think the CAT command will do offset ) sequentially. You then press V>M, rotate the channel selector one click, and HOLD V>M, and bring the next channel info to the VFO from the software.

repeat as desired

It IS theoretically possible to make a contact closure using a transistor or optoisolator across the proper front-panel key and the "up" button on the mic, and have the software control that closure, for fully automated memory stuffing ( figure it would be slow as well, but better than manual ) but that kind of "macro" operation without feedback to the computer seems to be a nghtmare waiting to happen.

Maybe you could write a routine that will present a memory's data into the VFO, electronically "press" V>M, then "up", then hold V>M, then "press" M>V, and compare the VFO contents just read out of memory to see that the proper steps completed... then do it all over again. The kind of mindless task a computer is excellent at.

Topic: 13428  Message: 13467

Well, I would love to see a program that I could dump memories into, even going thru the M>V routine. If it was able to allow me to sort the list (i.e. separate everything out in bands (80, 40, 30, 20 , and so forth) and change channel properties), then I would be willing to do a little manual labor. Seems it may be better than the drawn out process done from the front panel.

Or
> is that too complicated to do the limited capabilities of the FT-100 Cat
> port?

The best way to compromise the memory issue would be to have the software ready to present to the VFO each full channel data incl.mode, tone, offset I think the CAT command will do offset ) sequentially. You then press V>M, rotate the channel selector one click, and HOLD V>M, and bring the next channel info to the VFO from the software.

repeat as desired

It IS theoretically possible to make a contact closure using a transistor or optoisolator across the proper front-panel key and the "up" button on the mic, and have the software control that closure, for fully automated memory stuffing ( figure it would be slow as well, but better than manual ) but that kind of "macro" operation without feedback to the computer seems to be a nghtmare waiting to happen.

Maybe you could write a routine that will present a memory's data into the VFO, electronically "press" V>M, then "up", then hold V>M, then "press" M>V, and compare the VFO contents just read out of memory to see that the proper steps completed... then do it all over again. The kind of mindless task a computer is excellent at.

I have passed the suggestion on to Bob Freeth bob.freeth@... who
wrote a very nice Yarsu contol program called FTBasic.

Maybe you could start with his program and load the memories manually as you
said. http://dialspace.dial.pipex.com/town/avenue/aci07/polarplot/

Look at the top for "FTBasic"

Another terrific idea I have used to load dozens and dozens of memories for
a friend is to have a "QSY'er" keypad connected. You tap, tap, tap in the
frequencies ( and mode and offset if necessary ) then to the "V>M"
hokey-pokey

http://john.hansen.net

disregard the statement that the frequency keyer is for iCOM... he also has
Yaesu FT-100 and FT-817 supported

Thanks

You're welcome. I claim no credit for the mod. I got it off one of the web sites and just did it a couple of days ago. When you put the mic back together, be sure that the small switches on the side are put back properly. The predominant curve goes towards the face of the mic.

Alex,

If you are using the MH-36B mic, you will need to remove the mike element that is surrounded by rubber from the plastic tube. Use a small pointed instrument (a dental pick is ideal) and carefully lift the element out of the plastic tube. The element will NOT separate from the rubber. After you get the element and rubber surrounding it from the plastic tube, shake the mic upside down and remove the plastic baffle (the same size as the diameter of the inside of the plastic tube). Then, look through the plastic tube and you will see that only 2 of the 3 mic holes are open. Use a sewing needle and poke through the one that is plugged up. Set you mic gain to 55 and you will find that your audio reports will be much better.

Good luck.

Anthony, thanks for responding. I am going ahead with the mod on the fan myself. Glad you are having good luck with yours also.
The mic mod is a bit confusing since mine has the mic element surounded by
rubber and then inserted into a plastic cylinder.
Thanks again.

Pres,

I went to John Hanson's web site. But I didn't see anything that mentioned support for Yaesu. The keypad looks like it would be handy for mobile operation if for nothing more than a safety issue. It's much easier to enter a frequency via a keypad than to have to drive down a street or highway and watch the display on the radio while you turn the knob.

That's one reason I'm getting static from the XYL about installing the FT-100D in our Buick when we take road trips. In essence she is correct, but I hate to admit it. (Uh, pardon the word "Buick", but keep in mind I do own a '91 Ford F-250 that runs on gasoline or propane, depending on how the switch is flipped). On that subject, what can I do to improve the gas mileage on that gas hog? Seven mpg pulling the trailer or not, sucks! Answer direct to wbØdul@..., as I don't want to get into a mileage discussin on the reflector.

The whip hole for the ATAS is narrow. I modified mine (i.e. drilled it out larger) to accept a standard Larson whip. Larson whips are also black.

I have two and would highly recommend them. Not only do they implement direct frequency entry, but they also have a bandplan built in and it enters the mode for you too!

Just to be clear, the Larson whip is longer than the ATAS whip. I used the edge of a metal file to file an indent into the whip, and snapped it to length, and then removed the bottom 1/2" of black coating with the file to make good contact. I put a bit of grease on the shaft to make sure the whip and the holder don't "weld" themselves together like others have experienced.

Hey Adam,

Now I'm curious as to if it is cabling causing some conducted spurs or bandwidth filtering it out, try to tune off frequency from 148.15 and see if you can find the spur on an adjacent channel.

Mike

From: morganquityesterday
Topic: 13428  Message: 13483

What happens is when power is first applied to the radio, the CPU wakes up, including waking up the display, then finds, "Woops, I'm supposed to be OFF," and turns the radio off again.

It's got to wake up when power is first applied to determine that it is supposed to be off.

Mine, although connected to a power source only once when I installed it into my Jeep, did the same thing. Before that, I had read some posts in here that that is the expected behavior. You can probably find those postings, but I cannot direct you to any specific message number. Try a search on "power on" or "power up" or something like that.

Hope this helps,

Turner - WA4MQY

Someone ( Vern of http://www.superantennas.com I think ) told me that the coil really sets the band... the whip is less important. If one were to install a longer whip ( say 60" ) would the thing NOT tune at the same point ( important because the coil inside is more spread out in the ham bands to find the sweet spot easier ) or would it still tune properly and the whole thing be more efficient?

BTW yesterday I saw it do the tune...past...reverse move on 6m, so maybe it is a feature.

I can say that for the first of dozens of installs I have a really good ground!

# 13485. High SWR

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-08 17:45:50 UTC
From: starfury22
Topic: 8763  Message: 13485

I have an FT-100 bought last July (new), and the serial number indicates a 2000 manufacture. I have a Radio Shack HX-100 20 watt 10 meter rig and a Hamstick in my car, and I replaced the HX-100 with the FT-100. SWR on the HX-100 at 28.4 was near 1.1 to 1. I put the FT-100 in ,and the SWR meter pegged and the output meter showed pegged oscillation and SWR on the FT-100). I cut the HF power down to "20" on the menu, and the SWR was still pegged and RF was getting into the audio. I hooked a ground wire (#12) from the antenna feedthrough mount on the back of the FT-100 direct to the ground bus I have in the car (braid to ground on the seat mount to the car body). It made no difference. Am I ready to send it to Yaesu for the SWR mod? So far, the Radio Shack is better than the Yaesu.

Thanks, Lee. I had been running that around in my head and it seems like the best solution. I have a hard drive that I was going to move into the new unit anyway.
Thanks again for responding.

> the SWR mod? So far, the Radio Shack is better than the Yaesu.
> "Discouraged and ready to dump all Yaesus"

Yes, the SWR mod is called for. If it is out of warranty ( and I feel it should not matter but who am I? ) you could do it yourself, and while you are at it add a resistor from the black wire of one of the fans to ground to idle it slowly all the time. Do those 2 things and you will have a radio that makes you proud.

Thanks

# 13488. ATAS-100 and Strap Wrench

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-08 19:17:57 UTC
From: John McClain
Topic: 13488  Message: 13488

After reading about the problems that some have reported about broken wires in their ATAS-100 antennas, I have started to use a rubber strap wrench that grasps the chrome base. This will remove all stress from the parts of the antenna except for the connection between the chrome base and the SO-239 connector. Will this eliminate the broken wire problem? My ATAS-100 is installed and removed each because I can't trust the neighborhood kids.

OK, I'll turn it around... why do you need a wrench> I Only hand-tighten it.
And the electrical tape "joins" the chrome base to the black tube, making
sure the tube does not twist differently then the base, reducing the
internal damage possibility

Unfortunately, no. There is no locking mechanism that I am aware of. Most evenings I remove mine and put it inside the wagon. I have heard of someone using the large maglite holder brackets as a snap in holder inside the vehicle to stow the antenna.

Date: 2002-04-08 20:50:30 UTC
From: ki5mp
Topic: 13497  Message: 13497

Ok guys and gals. What is the general consensus on what is the best CAT software (for the Windows platform) currently available for the FT100D? The ones I know of are: CAT100, CATspaw, FTBasic and TRxManager. I have looked at the demos of all of them, but haven't actually tried them yet (waiting on my CT-62 cable).

Just looking for some comments from those who have actually used some of these packages.

Thanks,

Mike KI5MP

That is possible, and about the only way to do it, and is fairly labor
intessive from the operators point, as it will require lots of twisting
of knobs.

Probably easier to just re-enter the freqs as needed into the correct
memory channels.

From: backhoefade
Topic: 13500  Message: 13500

Last night I fired up the FT-100D / SB-220 combo and ran 1 kW AM. Got a 20 dB over S9 report down the coast in LA on 7.290 MHz. The guy said my audio was "great". He was hard pressed to believe he was listening to an FT-100D on AM. Most of the "Ancient Modulator" group are running old Vikings, Apachees and other Jurasic era glow-in-the-dark boat anchors. Kinda fun to run the FT-100D on AM. Definitely one versatile high performance rig!

Topic: 13501  Message: 13501

I am very upset about the sex and porn e-mail that I am now receiving because of Yahoo's changes to their privacy policy. When this change was first discovered last week, I immediately made the appropriate changes to my profile at Yahoo but it was too late. I am getting this junk every day and there doesn't seem to be anyway to stop it. I respond to each porn e-mail's instructions on how to be removed from their mailing list but the mail is returned to me from yahoo.com saying that it is undeliverable. I would like to forward this mail on to yahoo so that they can correct the problem but they seem to have protected themselves by not having any or many e-mail address's. Contacting them via their web site is the only way that I have been able to find. Does anyone know of an e-mail address that can be used to forward junk mail to them? What yahoo has done to us is unforgivable.

What I did for mine was drill and tap a 6-32 set screw in the chrome base about 3/4 of the way down the base. I then mounted the antenna and tightened the set screw down to mark the so-239 threads. I then filed a small flat there on the threads. Unless someone is equiped with a hex head wrench in the right size for the metric headed 6-32 set screw then they play hell trying to trun it off by hand or strap wrench. I also did the same for my Comet 144/440 dual band antenna. About the only drawback to this method is if you don't use stainless set screws it will rust in place, but where I live in humid wet (dry) Florida I always use stainless on everything exposed to the elements.

John, the problem is that you are responding. By doing so you are verifying that they have a correct address and that someone actually is receiving the mail. If you are using Internet Explorer, you can go to Messages and then Block Sender. You can also create a rule that will delete the junk from the server before it is sent. If you're not using Internet Explorer, then I don't know how to tell you to block it. Just don't respond to it to be removed.

# 13504. Front Plate interface

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-08 23:44:56 UTC
From: Russ Thompson
Topic: 13504  Message: 13504

I am a software programmer, so hardware is way out of my league. However, it seems to me that if we could break the interface code between the front panel and the main case, we could build a interface to allow a Linux or windoze based application to imitate the front panel. Once that was done, the software could do anything the op can do, plus would be useable even for those of us that at FC20s
Has anyone looked at that possibility?

If you do install windows first. The Redhat install will do all the work for you to set up the dual boot.

Also take a look at Mandrake 8.2. It's based on RedHat and is a lot friendlier to the Linux newcomer.

Well,

Decided today that I'll have Yeasu do all of the Mods and check alignment on the rig..

radio had recently started the High SWR issue and I hardily use the 2/440 side of the rig.. so not to worried about the fan issues as of yet..

the clock is now ticking.. to see how long it takes to turn it around..

I called Yaesu before I put it into UPS hands.. and asked about the cost to do the mods..

Mike at Yaesu says their is no cost, even out of warranty... thier is a cost to check alignment of about 50 to 70 dollars..

We shall see..

I think that this would get into some serious hardware and software
hacking. We would need to have some sort of i/o cable between the front
panel & the computer, along with the programming.

Sure, unscrew it yourself and put it in the trunk when you park the vehicle... :>)

Alternately, I guess you could drill and tap a couple of holes in the base and run a couple of allen set screws up against the so-239 mount. But then again, the thief would probably jsut break it off for spite if they couldn't unscrew it. So the trunk is probably the most "reasonable" idea. Any body else have a slick way to secure this antenna?

For others who may be waiting for FT-100D warranty work, I was
told that the current wait is 5-6 weeks.

My FT-100D arrived at Yeasu on March 6, and was logged in on March
11. The radio has not yet been assigned to a technician, but if the
return is in 5-6 weeks, I should have my radio back within a couple
of weeks.

If anyone has received their radio from Yaesu within the last
couple of days, I'd be interested to know how long the radio was gone.

From: kg9jp
Topic: 13518  Message: 13518

I've had a problem with the fans in back of the radio for some time.....they don't work at all, period. I found the problem last summer before making an 1800 mile move, so I didn't have time to send it back to the factory. I rigged up a small computer fan to blow air into the radio, and that works fine, but was hoping the fan mod would do the trick. Didn't happen. Turns out, I tested the pins the fan plugs into on the board....only getting about .05V.next to nothing. Anybody have any ideas? I'll live with the external fan rather than send the radio out for repair...the radio is 3 years old and works fine with the external fan.
Since the radio is remotely mounted in the trunk, the noise from the fan isn't an issue.

Tnx..... K.C. - KG9JP

> I've had a problem with the fans in back of the radio for some

Pin 2 (where the red lead mates) is fed with 13.8vdc continuosly thru a 1.8 ohm 1/4 W resistor (R3532). Pin 1 (where the black lead mates) is grounded thru either Q3003 or Q3507 (one V/U the other HF). So by putting in a resistor from the black lead to chassis (50-75 ohms) will get the fans running continuosly at a slow speed. If that doesn't work then you need to locate R3532 (1.8 ohms) on the PA pcb and replace it (SMT resistor) or short it out. The two transistors merely ground the black lead to chassis and are controlled by the microprocessor and thermistor control circuitry. There is also a mod that YAESU does which adds a thermal switch on the heatsink of the V/U finals that also controls the fans independent of the other controls. Commonly referred to as the Thermal mod.

Thanks Mike,
The mod by adding the resistor does nothing. Sounds like a job that I'm not prepared nor dio I want to handle. I've rigged it up with an external fan that runs all the time and the radio has worked fine that way for the last 9 months......oh well, it was worth a try.

Gerald,

Mike at Yaesu told me 3 weeks to do all the mods and re-alignments. I shipped the radio March 14th, 2nd day air. It arrived and was signed for. I called today (4/9), since over 3 weeks had passed. I spoke with a woman with a heavy accent. She said no radio's were worked on during the 2 week move!?!?!?!? A tech will be assigned to my radio shortly. I informed her I need the radio for a corss country trip starting 4/22... She told me it was doubtful I'd see the radio even if I paid return shipping. 25 days and no one has looked at my radio.....so much for 1 year warranty. My point according to NH law ...where I bought the radio they have to extend the warranty by the days it's down during the warranty for repair. Soon it will be a month. But get this ..The radio had a bad microphone and it was down for that for 3 weeks... So Yaesu needs to extend my warranty by 46 days as of today. Factually, considering I bought it in October 2001, they should be giving me a new radio... Hell Sears gave me a new projection TV because they couldn't get parts from Sony, maybe Sears should sell ham radio...Best regards..Larry W8LM 0

Personally I think this is bogus. For example, I had a friend align my radio extensively with a IFR monitor. He took hours to do it and re do it.

I sent it in once and specifically told them not to mess with the alignment, which they did not do...

So if I sent the radio in for out-of-warranty factory re-work, would they charge $50-70 for paperwork instead?

"Oil and filter change free... taking the filter out of the box: $23.95"
How's that?

Pres...

My GMC dealer keeps sending me coupons to bring my new 2002GMC Serria
in for a oil change and filter for $14.95...
Can I hold him to it??

I have a Duramax Diesel... Filter is $24.95 and it uses 10 quarts..
at least I have no ignition noise... BTW I'm getting 22mpg... My
odometer says 5435.. not time for the oil change... book says 7000
miles. Can't wait to break it in.

The serial number on mine starts with 1L (October, 2001 Mfg date). Yours starts with 1H (June, 2001 Mfg Date). No Blue Dot on my Box labels or on the bottom of the radio. I purchased mine on 3/25/01.

What I do is forward each piece to abuse@..., webmaster@..., postmaster@... as well as to the same "persons" at any other server address I find when I do a "view details" on the message. I also cut and paste this "view details"info page into the forwarded message.

I made it easy by creating a message template for this purpose. A quick cut and paste, then forward, and it's done. In the case of those phoney pyramid schemes, chain letters, and the "give me your bank account so I can send you 50 million dollars" I also indicate that a copy has been forwarded to the "US Department of Justice, Internet Fraud Division". On these, I have received many responses from Yahoo indicating that the sender's account has been cancelled - and I never receive another piece of spam from that sender again.

The one thing you *DO NOT* want to do is respond to any "remove me" links in the message. All this does is tell the sender that they have a "live one" and they can add your email address to the "verified listing" that they sell to other spammers.

# 13531. Time to unsubscribe...

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-10 21:10:58 UTC
From: n1evh@aol.com
Topic: 13531  Message: 13531

Well folks, after 2 years of being on this list... it is time for me to unsubscribe from it. I will no longer have a WORKING FT-100.

I sent my FT-100 into Yaesu back on Dec 17th. Yaesu received it on Dec 26th. Now I didn't hear a thing about my radio until I called them on March 22nd. When I called them then, I was told that a technician had just got done looking at my radio and I was given an estimate of $608 to fix my FT-100.

I thought this was pretty high. So my call was forwarded to some tech there that I spoke to about my radio. As I was talking to him about my radio and why the estimate to fix it was so much, I heard him say "now why does the tech want to replace that". He said he would talk to the tech that did the estimate on my radio and get back to me on Monday (March 22nd was a Friday).

Well today (alomst 3 weeks later) I heard back from Yaesu about my FT-100. The estimate I got today was still $608. I told the person on the phone not to fix the radio and to send it back to me cause for $830 I can get a brand new FT-100D. They asked me is I wanted them to see if they could get the cost down. Asked them what can they do in a few minutes that some tech couldn't do in 3 weeks.

No matter how many times I told them not to fix the radio and to send it back to me... they to send the radio back to me, the person kept asking me if they wanted me to see if they could get the price down any. Finally I said to the person..."can I ask you a question". They said yes. I then asked them "after about 10 times... what part of "do not fix the radio and send it back to me?" do they not understand?"

Now back in 1991 when I had an FT-727 dual-band HT that went back and forth between MA and CA 7 times in 9 months... when I sold that radio I said I would never buy another Yaesu radio. In the past 4 years... I've bought... either new or used... about 10 Yaesu radios. Never again will I buy another Yaesu radio.

Subject: [FT100] 1 kW AM with the FT-100D

Last night I fired up the FT-100D / SB-220 combo and ran 1 kW AM.
Got a 20 dB over S9 report down the coast in LA on 7.290 MHz. The
guy said my audio was "great". He was hard pressed to believe he was
listening to an FT-100D on AM. Most of the "Ancient Modulator" group
are running old Vikings, Apachees and other Jurasic era glow-in-the-
dark boat anchors. Kinda fun to run the FT-100D on AM. Definitely
one versatile high performance rig!

Subject: [FT100] Status on FT-100D warranty.

Hi fellow FT-100 owners.
Here in VK land a new FT-100D goes for $2,890.00 or about $1,400.00 US dollars and the FT-100 still sells for $2,000.00 or $1,000.00 US. But when you work it out that we get 2 years warranty and the average turn around time I have experienced is 2 weeks with no extra money to pay for to and from shipping, I think we have a pretty fair deal. It also might be that we have compared to W and G land alot less Ham population, hence the shorter turnaround time and more $$ for the radio.
VK2NEW Anthony.

Well ... The same experience I had ... and the group here has already heard my story. I learned from the experience ... I bought an FT706MkIIG ... I got it on sale and it cost me $ 100 dollars more than what Yaesu wanted to repair the Ft100 ... And the Icom came with a 1 year warranty, not 30-days, and I got a free remote kit ..

I hope you look at the Icom ... It runs circles around the Yaesu ... and I will never buy another New Yaesu product .. Don't think they (Yaesu) has gotten the point yet however.

# 13541. Yaesu repair time

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-11 01:48:26 UTC
From: wb4tdb@aol.com
Topic: 13541  Message: 13541

With all the comments concerning the turnaround time for Yaesu repair I would like
to share my experience.

My FT-100D SN9K110653 developed a problem on HF receive, it was almost deaf
As it was still under warranty it was shipped back by the dealer.

It arrived on Feb 13, 2002 assigned on Mar 19, 2002 and completed May 20, 2002.

It was shipped and received on Mar 25, 2002.

The repair ticket has the following
Parts replaced
Part number Part location
G2060013 D1008
G2070476 D1007, 20, 21, 22, 23
G1091677 Q1060
G4070009 Q1023, 28, 29
G2070176 D1032, 37
K22124805 C1033, 39
J24185151 R1055

Replaced defective on Main Unit
Cleaned up grounding contact on LPF unit and installed SWR grounding mod.

Total cost $0.00.

It now works great. It was never used mobile only in the shack.

The only problem I have now is while the FT-100D was in California I purchase
d
Kenwood TS-2000 and now I have a hard decision to make do I keep both
or sell the FT-100D?

The turnaround time and cost seem to be very reasonable.

Hey Vollie---

I'd install the FT100D in that time machine you have because your telling us on April 10,2002 that the radio was fixed May 20,2002. Do you recommend traveling back in time so all repairs will always be made during the warranty period. Another good use for that time machine. Saturday's Mass lottery is over $200 million, can you get us the numbers? $200 mill will keep everyone in the group buying FT100's-good for ham radio, good for Yaesu. April Fools???

My total turn around time was 17 days to get the spurious and fan mods done. But that was in early April 2001 before the spurious stuff hit the fan. Then everybody started lining up.

Kirby,
My radio was sent in to Ceritos (only about 50-60 Miles from
Victorville) on Feb. 22, assigned to a Tech on Tuesday, April 9th, and
was being shipped as of yesterday. I was told by a Tech in Feb that
the turnaround was a remarkable 2-3 weeks max. Go figure!! And yes, I
expect my warranty to run past the year of my purchase by the # of
days out of my hot little hands!! Thanks for the bandwidth,

From: Eric van de Weyer
Topic: 13488  Message: 13547

I don't know why anyone would want any sort of wrench to tighten the antenna onto it's mount. I just finger tighten mine each time and have found that more than adequate even on long trips. If you tighten it too much you will eventually stuff up the thread.

Hi, Russ, this is federico, xe2nlm, and i have a ft-100d, and i also have a tm-v7a kenwood dualbander, and i am trying to do the same you tell us. about to break the interface code with the tm-v7a, even i already now some commands from the radio-pc port.(by the pg-4s)

i think the same could be make to the ft-100d and it will be very interesting and usefull,

count with me to make this proyect, please let me know how to help you.

kind regards to all the group.

From: "Russ Thompson" <russthom@...>
Subject: Front Plate interface

I am a software programmer, so hardware is way out of my league. However,
it seems to me that if we could break the interface code between the front
panel and the main case, we could build a interface to allow a Linux or
windoze based application to imitate the front panel. Once that was done,
the software could do anything the op can do, plus would be useable even for
those of us that at FC20s
Has anyone looked at that possibility?

Rich, There was plenty of info about CAT programming and interfaces when my FT-890AT was new. I recall you inverted the data lines with TTL @5 Volts. Stuff like a 7408, 74LS08 can invert. Then you ran it through the standard RS-232 to TTL convertors like a 1488 and 1489....Now since then there are a couple of "newer" devices that eliminate the need to invert. The 1488-1489 inverted the logic as well as converted the voltage levels. Hence the need for the TTL inverter(7408) Someone was creative enough to put the whole thing in a DB-25 hood...All old fart computer buffs remember DB-25 hoods...for you kids out there the serial port used to be as big as your parallel port on your laptop.. They both were DB-25's at one time long ago in a place far far away. And CPU's ran at HF frequencies.

Someone will give you a better answer but it can be junkboxed for $10 or less.

From: GARY GADWA
Topic: 13555  Message: 13555

Just thought since there is such a continuing thread on the Mic Mod, I'd just ad that I did it to mine quickly and easily and after punching the third hole I opted for just turning the baffle plate so one hole is in the clear (leaving the baffle in). Audio reports from operators I regularly talk with immediately exclaimed, "Your audio is crisp, sharp and clear, like never before" Most also indicated they felt my audio was always a bit muffled before but never commented about it. I ask if any thought it was to sharp and no one thought so.

Alas, a great radio sounds even better.

From: n9cv
Topic: 13553  Message: 13556

If you go to Sears Hardware, or any other place that has sink repair parts, you can find a flat fiber / rubber washer that has a larger outside diameter and is thinner in thickness that a hose washer. The thinner washer allows you to screw the ATAS-100 down closer to the bottom of the mount. The larger outside diameter washer allows you to spread out the sideways pressure between the ATAS-100 and the mount. The washers are available large enough to cover the entire base of the ATAS-100. I glued mine to the mount to keep from accidently loosing it with the antenna removed. I put silicone grease on the top of the washer where it meets the ATAS-100 base to allow for easy removal. Light hand tightening of the ATAS-100 is sufficient. I have never had mine come loose on it's own. Approximate cost of the washer is US$00.25 (that is 25 cents).

Another thought is you might want to try is to mount the ATAS-100 a little lower on the vehicle, so it does not have to be removed so often. Mine is lower and I run my ATAS-100 into the upper garage door frame at least once a day. I have mine mounted so the stinger part of the antenna hits the frame when pulling in. When I get out of the vehicle after parking, I insert the loose stinger end into a plastic cable tie mounted to my roof rack. I have a picture of this and I will send it to you if you are interested.

# 13557. Has anyone else noticed the poor response time on Yahoo groups?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-12 05:19:01 UTC
From: n9cv
Topic: 13557  Message: 13557

Ever since Exodus (the web hosting company for Yahoo) went bankrupt, (Their stock is at 2 cents a share), I have been noticing poorer and poorer response times from groups.yahoo.com. Sometimes it is over a minute to paint a single screen. Add to that the advertising screens and graphics that has been added for cameras, credit cards and the like, and at times this group is totally unusable. Yahoo is now hosted by Sprint (Level 3 Communications) and the problem is worse than before.

I have tested this during the day, in the evening, and in the middle of the night. All times seem equally bad at times. I have tested from three different ISPs using Genuity, Sprint, and AT@T on this end. I have also used a dialup modem, a cable modem, and T1 from different vendors to access the Internet on this end. The same problems occur using all of the different combinations of accesses and vendors.

Using VisualRoute I see that the problem is in the Sprint (Level 3 communications) transport and at the yahoo server end itself. The path I am seeing at the moment is 16 hops to yahoo. Two of the Sprint hops are showing 40% and one showing 30% packet loss. Right now it is 12:15 AM CDT which is hardly a busy time.

I am just soliciting comments and raising the future possibility of moving elsewhere is the problem gets any worse. I do not know where else we cound go, but it is a thought if others are as unhappy as I am with the current level of service.

# 13558. Re: Yahoo email address? => Try Mailwasher

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-12 06:58:46 UTC
From: Jeremy Taylor
Topic: 13558  Message: 13558

John,
If you are plagued by spam, do not reply - as Dick said, this just tells the spammes they have a valid address to spam. The answer is to BOUNCE your mails. This is not easy if you are not a system administrator/server wizard. But there is another - EASY - option.

Mailwasher is a small free program - it has a nag you can have removed for a "tip" of $3USD or more - that you use to check your mail BEFORE you run your mail program.

Most spam can be identified without downloading it by merely looking at it's subject line - and if you aren't sure then you can "preview" it inside of Mailwasher. For anything you identify as spam you (1) tick a checkbox to "bounce" which sends a bounce to the spammer so they thing the email address is invalid, (2) tick a checkbox to "delete" the mail so you don't download the message when you do start your email program later on, and (3) tick a checkbox to "blacklist" the address it came from so anything that comes from there again will be automatically ticked for bouncing and deleting. (If you click "blacklist", "bounce" and "delete" auto-tick, so you really only need to tick one box!

The software also takes guesses at the contents of the mail and will tag it as "Normal" or "Possible Spam" or "Chain Letter" etc. Sometimes it gets it wrong - eg yahoo group-digest mails it sometimes thinks might be chain letters (lots of email addresses in the body). No worry here - the tag is just a warning for you to check it out. It doesn't delete these. In fact, the software also has a checkbox to say the email is from a "Friend" and this goes on a whitelist - everything from that address in the future will be marked as a friend, so that you only have to worry about checking the emails from people that are not already marked as "friends". Once you tick a email from a friend - or a yahoo group digest - as being friendly, they won't be marked as possible spam or chain letters ever again.

You can sort on the tag, so that all the "friends" are grouped together, and all the "normals" and the ones with warnings - so it is easy to go through only the non-friends and tick the appropriate boxes to either blacklist or whitelist.

This whole thing takes a only a few minutes - mostly to download the headers if you have a lot of mail - and only half a minute for you to go through and tick the boxes. Then you click a button to "Process Mail". It does the bouncing, deleting, and black/white listing. Then it opens your default email package.

You download your email as normal and presto! no spam downloaded, and you haven't even had to look at it (unless you had to use preview to check the contents - which only displays text,not pictures, and html shows up as html code and if I see that I just delete it - no one except spammers sends html email to me! They're the only idiots to use it for email.)

And the best part is, after a while, the dozen or so worst spammers in the world (did you know it is mostly done by only a small handful of people?) decide your email address is bad and they take you off their lists, and they stop putting your email address on the CD's of email addresses that they sell. They don't want to be buggged by their mail boxes filling up with bounces. Well boohoo - I don't want my mailbox filling up with spam!

In the 3 months I have been using Mailwasher I have dropped from about 10% spam to about 2% spam... each time I dial up these days I might have 3 or 4 at most, and sometimes none or 1 if I am checking more regularly than I usually do.

Mailwasher is available from http://www.mailwasher.net

I am only a happy user - not associated with this person, except that he is a fellow New Zealander!

I just got my new FT-100D (sn:1N290108) last Tuesday.
I noticed that the lower left knob wiggles and the
rachet action when I turn it is not as tight.
Is this normal?

I pulled out the plastic knob and it's not that the
knob nor pontentiometer that's loose from the
faceplate but the inner shaft.

No, sorry, that is not normal. The SELECT knob on my radio has no side-to-side movement and there is a nice, smooth, detented click when turned. Sounds like you have a "bad" one.

Just went to HRO in Burbank this afternoon and checked
out the FT-100D display. The knob is as loose as my
new one.
So either I'm just paranoid or that radio has the same
defect. hihi .... ..

I read from work (on coffee breaks and lunch, of course), and from sitting on a T1 line on the east coast, I only see a 3-7 sec lag from click to paint, even with the ads. At worst, I see 10-15 seconds, or it doesn't work at all.

When I first came up with it, I did the same thing... In or out its the same thing it seems. Simply orient the disc so that the flat end exposes the holes to the element. Chas removed his totally and experienced the same result so removing it totally was incorporated into the mod. "Six of One, half dozen of the other" as they say... Regards.. Richy

Hi Tabby,

Yes the switch is cheesy.. It will also false (jump freq sometimes) after some usage.. The replacement from Yaesu parts seems to be better than the original and you can install it easily but I would not send it in to fix it nor would I do it under warranty. I would live with it if you can until it really tees you off :-) ...

From: Blaine
Topic: 13515  Message: 13588

Hi Ed,

Having seen some other recent emails, let's speculate on the blue dot.

I suggest that a blue dot on the box (not having seen one yet) means the mods were done after manufacturer (but before sale) Maybe that is why California is now all of a sudden so much busier. Any high or higher serial numbers without the blue dot is a radio had the mods done at manufacture time. Or the QA dept forgot the dot. Other manufactures (all types of equipment) have done such marking techniques to identify included changes and ECO level.

Would it not be nice to be able to buy a radio that was labelled SN123456/K, for example, so you would know that changes A though K were done and that you could find out what changes A through K were. Large manufactures don't try to hide the version information. It may be hard sometimes to find what the changes actually were, the auto industry is a good example, but you can usually find out with enough effort.

Sent my 100D to Radioworld during it's last month of warranty (march 02). S/N 0k070600 for poor ssb quality, hot on vhf, and to have the AM filter installed . Rig back home in four weeks, performance is absolutley outstanding in the audio dept. Am getting comments on the audio quality from stations who know me and from first time contacts without my asking about it!!! The invoice states that theydid TSN 0201,tested radio to specs. Parts installed n/c were two N7090039 and one R0132940 clip n/c. The only other thing was the 6khz AM filter which I paid for but they installed without a labor charge. Have read about others with long waits in the USA but I can say that I am very well pleased with the service I have received North of the 49th! By the way I noticed that the third hole over the mic element has been opened up.73 Bo

Fired up the FT-100D and throttled it back to a whopping 5 Watts output. 40 meter CW, 4 AM PDT. Got a 589 out of JA land using a G5RV up about 35 feet. A 589 on 40 meters into Japan ain't bad!

I bought my FT-100D about a year ago. I bought because of the ATAS-100 antenna. I needed an antenna that required no holes and had to be wife approved. I have the ATAS-100 mounted about chin high on the back of an Olds Van. The radio is mounted inside an after market center console. The control head, mike holder and MFJ speaker are mounted on a modified cell phone holder. The provides easy operation (without looking) of all controls, with arm resting on arm rest.

I get super reports from the DX I work. Many can't beleve this is a mobile rig.

Only problem. Original installation was with seperate antennas. Then I added a duplexer (Comet) and after that I had tuning problems with the ATAS-100. I called vendor (HRO) and tried all the grounding tricks, etc. I finally took out duplexer and all problems with tuning went away. Either I have a bad duplexer or some sort of weird problem. However, I can count the number of times use 2 meters in a month on one hand. So, no big deal.

=======================================
Blaine, et al,

The use of color plastic "dots" for indication of mods has been used by
Yaesu for some time. A few years ago when I bought my FT-100 from Lentini,
Newington, CT they sent it back for addition of a couple options...including
the narrow CW filter (which works great), and they gave the instruction "to
include all mods". It came back with a green plastic "dot" on the box which
Lentini told me indicated the mods that had been included at that time.

By the way, I have never had the VSWR gremlin nor the "hot plate" demon.

My guess is the duplexer is not DC isolated to the vhf path, or is not passing the DC through the HF path properly. This will upset the voltage to the ATAS so affect tuning maybe. Check the resistance.

# 13599. FT-100D Mods

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-14 23:26:01 UTC
From: vk2new
Topic: 13447  Message: 13599

Hi group,
I have noticed that many FT-100/D's which have had the grounding mods performed to the internal coaxial connectors are different. For instance mine which was purchased new in VK land in Sept 2001 and with a serial number which starts with a 1D (2001/Feb), has 2 copper clips connected to the centre rib of the chassis. The first clip has a short length of braid solderd to the coaxial connector on the LPF board, which is noted in my FT-100D service manual to be the connection between the HF/6M Tx (J5015) LPF board and the PA board (J3005).
The second clip and braid is solderd on the main board on the HF/6M Rx (J1003) connector and the coaxial cable is then routed to the LPF board (JP5001).
I have noticed on different photos that some radios are different to mine and each other, but all in all my radio has performed with no problems what so ever.
73, VK2NEW Anthony.

> short the stock?

I do not own, have never owned, nor do I intend to own any Yahoo stock. Also I have no stock in any competitor to Yahoo, or any supplier to Yahoo. I stayed out of the Internet stock craze both on the way up and on the way down.

I am just very unhappy with the poor Yahoo response time that I have seen getting worse in the last six months. I will admit that most of the time that I am on Yahoo it is very late at night. Maybe Yahoo is using most of the bandwidth or server cycles at that time doing off site backups or something.

One of my major clients also has had the same Yahoo complaint. My client is only on the Internet between 8 to 5 during the week using a 6 megabit (4 T1s) connection. My conclusions, after testing, was that this is a major problem.

This must not be as wide spread of a problem as I thought. When the problem starts here, I do something else in another session while waiting for Yahoo to respond in the first one. Yahoo will eventually respond, it just akes a while. I only use Yahoo to view this forum anyway so it is not a major problem for me.

If no one else sees a problem, then forget my previous post and kill this thread.

Interesting. I never knew anyone to send in their microphone. It is also interesting that they modified the microphone. Is someone at Radioworld/Yaesu monitoring this group? If they are not, then where did they get the microphone mod idea?

# 13604. Longer whip on an ATAS? Data Point

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-15 16:43:56 UTC
From: w1pa
Topic: 13604  Message: 13604

I know this string has been kicked around a few times, but I wanted to offer up a data-point.

Back when I mentioned I modified my ATAS (i.e. opened up the hole for the whip a bit) to accept a Larson-standard black whip, someone emailed me and asked why I bothered to cut it to the ATAS whip length (about 12" shorter), and didn't just run the full-size whip.

Well, I played a bit last night between turning steaks on the grill with a Larson cut to the "correct" length and a full-size Larson whip in the ATAS. Yes, it will tune 6m-40m on either whip.

I did notice, however, that on the longer whip 40m was much more sensitive to tune (off the wider pitch portion of the tuning coil?), and some of the SWR nulls were not as low on the longer whip (e.g. -- 15m: one SWR segment on the correct length, 2-3 segments on the full-size, same frequency)

I'm wondering if the three caps that are incorporated into the base tuning section are optimized for the reactance produced by the length of the whip that comes with the ATAS. I didn't have a field strength meter with me, so I can't comment on that -- I know that a good match doesn't always reflect good radiating efficiency; a dummy load is a perfect match.

Anyways, I'm going to stay with the whip cut to length.
Just one data point.

Bill

Hi,

Does anybody know which model of the MFJ Soundcard-to-Rig Interface
should be ordered to work with the FT-100 ?
I bought a hand held microphone ( HMM ) from Heil and I have also got
the AD-100 adaptor. I guess that the right model to choose in my case
is the MFJ-1275 but I am not sure.

From: Paul Henning
Topic: 13606  Message: 13608

Try a trunk lip mount on the rear edge of the hood. I have a 1996 GMC K2500 Pick Up with the same hood problem as your Suburban. This was the mounting recommended by a Yaesu rep talking with a Comet rep at the recent ASE SuperFest in Milwaukee. Seems to work quite well. Be sure to ground the hood it self and the ATAS. The installation even looks quite good (beauty being in the eye of the beholder I guess).

# 13609. Mount for ATAS-100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-15 23:49:21 UTC
From: w3klf
Topic: 1119  Message: 13609

I used a Diamond K400C Mount with C110 Extension for my installation. It should work for about any vehicle built. Mount has 6.5 feet of mini coax and swivels for any angle. Extension connects mini connector using 10 feet of coax to PL-259. Mine works SUPER!!! The mini coax can pass through any rubber gasket, without harm to coax or gasket.

# 13610. Re: [FT100] MFJ-1275 or MFJ-1275M Soundcard-to-Rig Interface

Michel,

The MFJ-1275 is the only Interface they make. If you were looking in their catalog and saw two, one was the front and one was the back. Be sure to confirm that the mic connector on the front has the same number of pins as your mic.

# 13611. RE ATAS on 99 Suburban

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-16 01:17:52 UTC
From: John L. Gianotti
Topic: 13611  Message: 13611

I have a 99 Tahoe 2 door and use a Comet mount on the back door of the Tahoe. I have the split door (glass goes up and the tailgate goes down, like a picku) rather than the cargo doors. The only "problem" is in order to clear the glass when it opens I had to mount the ATAS about 2-3 degrees off of vertical, looks a little bizare, but works like gangbusters. Worked Finland, Scarbourogh, Latfia within the first week (as well as lots of stateside) of installing it and I only drive to and from work about 10 minutes per day.

# 13614. FT-100 Upgrades

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-16 22:10:52 UTC
From: Michael A. Waldron
Topic: 13614  Message: 13614

I have my FT-100 boxed up and ready to send to Yaesu repair (almost out of warranty) and I would like to make sure they get it right.

Are there specific names I should ask for the modifications? A process number, etc?

I know I am in need of the VHF overheating modification and the additional internal grounding, are there any other issues that may cause me long-term grief if I do not get them fixed?

Thanks!

-Mike

# 13615. V/U output transistor replacement

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-17 05:25:34 UTC
From: Lee Devlin
Topic: 414  Message: 13615

I got the following message from one of our list
members who sent it to me directly. I don't know
anything about the replacement part mentioned below,
but it has come up as a question on the list before
and certainly merits some investigation:

Dear Members

I have some very good news for you
I have discovered a replacement for the MOSFET /
transistor,
commonly reffered to as SRF 8043
used in VHF and UHF TX finals of the FT - 100
The magic replacement MOSFET is a BLF 546 - and has
a SOT268a case
just
like the SRF 7043
available from Phillips Semiconductors distributors
like "Arrow" and
etc.
at US$143.77
or if you buy 20, just over US$100 each
Ask me what they are really worth
Knowing Phillips they charge double to anybody else
for anything with
their
brand name stamped on it.
Phillips would make a profit if they charged about
US to US$8 each ,
and dearest part is the testing, packaging and
handling.

I know that you can buy the stuff from Phillips
factory quite cheaply
if
you are a big manufacturer and know ropes. Any
suggestions on this
topic
would be appreciated.

What's the SRF 7043 worth? about a $1
Now you are getting the hang of it

Yours truly Paulus - keeps on, keeps on saving people
money

# 13616. Re: FT-100 Upgrades

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-17 04:01:03 UTC
From: backhoefade
Topic: 13614  Message: 13616

I requested two items very specifically:

1) "Modification which addresses the spurious oscillation which is evidenced by the SWR icon flashing and power folding back intermittantly". You could probably just ask for the "SWR mod" and they will know what you need. It's up to you.

and

2) "VHF/UHF fan modification".

Then there is no question you will get what you need done.
Those are the only two items you should have done by Yaesu unless your particular rig has a unique problem which is unlikely.

I suggest that you do the "N2ZD mic mod" when you get the rig back.
It results in excellent transmit audio.

By the way, you don't have to send your mic with the rig for the two mods. I didn't. It left 'mic-less' and came back 'mic-less'.

Get ready to wait a while. I was lucky. When I sent mine in around April 2001 it only took 17 days. So fire up the old tube rig and look forward to getting your rock solid FT-100D back.

# 13617. 2nd Menu Functions

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-17 07:00:05 UTC
From: w6mdk
Topic: 13617  Message: 13617

Today I was playing around with the 2nd menu functions and
I "discovered" something which might well be known to the rest of
you, but was a surprise to me. If you increase the settings in, for
one, F15, you increase the output power significantly. For example,
by raising the setting to 255 (maximum), the output power on FM
increased to the following values:

Band Output (Watts)

80 175
40 175
30 108
20 190
17 190
15 150
12 150
10 110

Not knowing any more than this, I re-set the rig to the factory
default value (in my case, that is 121).

What I am wondering is:

1. What is the maximum that is safe for the rig?
2. Does raising the power introduce distortions or spurious
radiations of any kind?
3. Are there any other reasons to NOT do this?

If this has been addressed before, I'd appreciate being pointed to
the post. If not, any knowledge in this regard would be
appreciated. I figured I wouldn't get a straight answer from Yaesu.

# 13619. Never assume

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-16 23:18:10 UTC
From: kb3bmt@juno.com
Topic: 13619  Message: 13619

Well, I packed up my FT-100D (Serial 1Ixxxx) and sent it to the Yaesu Hospital today. It was good while it lasted. I made 400+ contacts, 33 countries, almost 300 counties . . . all mobile. I then started getting the intermittent high SWR problem and resulting power reduction. Antenna tuned good (less than 1.5:1 across the band). Did the same thing into a dummy load, so I figured it was time.

Since I had just purchased the rig new from HRO in January '02, I assumed that Yaesu had completed all the necessary mods before sending it out for retail sale. My excellent results over the past couple of months reinforced my thinking. But then the gremlin set in.

So, I pulled it out of the car and popped open the case. NO MODS! Didn't look like anything shown in the group's photos for the SWR mods. No copper tape, no grounding straps, no nothing. Man was I disappointed.

I asked Yaesu to do all the mods while they had it checking out the SWR problem. After all, it is under warranty.

I have an FT-747GX I think I'll stick in the car until the return of my old friend. The noise blanker is not nearly as good, but I really like having a rig in the car (I'm a service tech and drive 1500+ miles a week).

Sure am going to miss the old girl. But I know when she returns, she will be better than new.

From: Cliff Bryant
Topic: 414  Message: 13621

FWIW dealing directly with Phillips has always been notoriously difficult at best unless you are trying to buy huge quantities as part of a business. I've always dealt with a distributer in the past (though not for a few years). The prices are higher of course but still not bad.

As one who had to pay a fortune to get the part replaced I'd be delighted to get some spares. I'd like to see data sheets on the original and replacement parts first of course.

I can maybe chase my old distie for info. How many spares do people want? :-)

# 13623. ATAS makes my car shake?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-17 16:59:54 UTC
From: w1pa
Topic: 13623  Message: 13623

See if this sounds reasonable...

I mounted my ATAS using a Comet 730 mount on the top right corner of my rear hatch on a Subaru Legacy Wagon (a '98, but with 120K miles, original struts). I had moved it off the luggage rack because I was getting a better match mounted directly on the metal lip. The 730 is a mid-size mount, not a full size. I don't have enough of a straight metal lip above the glass on the hatch corner to use a full size mount.

Last few weeks I've been noticing a shake in my rear end when I get up to 65, 70, 70+ MPH. Thought I had a tire balance issue, but noticed this morning when I drove in without the ATAS on, the shake is gone.

At 80 MPH, could the ATAS cantilevered off the back of my car start oscillating in the wind, and get my car shaking, especially with those old struts?

Bill

# 13624. High SWR

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-17 18:47:42 UTC
From: frankweiss@aol.com
Topic: 8763  Message: 13624

Hello everyone:

I do not have a 100T (yet), so I cannot speak from experience. However, there has been a thread on this forum relating to high SWR readings when the 100T is used as a mobile unit. For those of you who subscribe to WORLDRADIO, I direct your attention to the May 2002 edition at page 59. The first two paragraphs on this page are as follows:

"One of the wrong ideas that seems to pop up every so often is that, in a mobile installation, if you have high SWR on the cable from the rig to the antenna or from the antenna tuner to the antenna that you will have horrendous losses. In a recent column on mobile antennas Krusty Olde Kurt explained that this is just not so. If you have a long run of coax, such as in your home station, you may have significant losses. But the cable in a mobile setup usually a short. So short that you'll have no losses to worry about no matter how high the SWR."

"Not everyone believes Kurt so let's look at some figures. Suppose the cable is 10 feet long and we are operating on 80 m. If the SWR. is really, really high, let's say 100:1, what are the losses? They are .64 DB. Is this horrible? For every 100 watts coming out of the transmitter we lose almost 8 watts. Could you tell the difference on the air? Not on your grandpa's eyebrows!"

I pass this info on for whatever value it may have for those having high SWR readings. I hope it has been of value to you.

73,

Frank K6FCW

# 13625. Re: [FT100] 2nd Menu Functions

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-17 14:14:02 UTC
From: Dick Thompson
Topic: 13617  Message: 13625

It's interesting to see what you found, Mike. But, IMHO you may be "playing with fire" if you increase the factory Power Output settings. Then again, maybe nothing will happen. I have a feeling that the PO is set on the basis of the finals in the rigs. I've run all kinds of rigs over the past 40 years on the bands, and in the past 6 months I've found that 100 watts will do the job, just not as quickly as a KW.

I'll definitely read, with interest, what the group has to say about your findings.

Sounds good, EXCEPT when you up the power output you also up the HEAT generated. Sounds like a poor tradeoff to me. You might even blow a final. I don't think you rig will last long at 175 watts FM 80 Meters.

The FT-100D is your basic "100 Watt PEP" rig on HF. It's
fan/heatsink system is designed to get rid of the heat that comes
from the difference in the input power minus the output power.
That's about (12x21)-100 = 140 Watts of heat flow. When you jack up
the output power beyond 100 Watts out you're going to do two bad
things and only realize one tiny good thing. The bad things are
a) the final amp devices will run hotter, thereby shortening their
life and b) the final amp devices will run at higher current than
they normally would which also will shorten their life. The slight
improvement you will get when you run, for example, 175 Watts instead
of 100 Watts output is 10log(175/100) = 2.43 dB increase in received
signal level versus running 100 Watts output. That's less than half
an S unit so it's a lousy trade-off. If you want a little louder
voice with the FT-100D do what I did and drive it into an SB-220 for
a full kW output. Now you have a 10 dB advantage. Even then it's
only about 1 1/2 S units. Still, 10 dB makes a major difference at
times. 2.43 dB isn't worth the extra heat. For mobile op a lot of
guys run the ALS-500 Ameritron mobile amp for a nice 500 Watts out.
That's helpful for mobile work. The extra 7 dB (a little over an S
unit) brings you up to par with a lot of base stations using simple
dipoles and inverted Vees at, say, 25 feet elevation. The 500 Watt
mobile with a decent whip can put out a nasty good signal.
I would leave the F15 control at the 100 Watt setting. Same thing
with the 2 meter and 440 MHz power tweak. Just leave it stock. Your
rig will thank you and so will your wallet.

Topic: 8763  Message: 13630

I'm not sure what the 100T is that you are talking about but if you mean the FT100/ 00D series of radios then the swr problem is actually a falsing in the radios power/vswr detector circuit. The detector is reacting to a approximate 13.5 MHz spurious oscillation that is a design flaw( IE poor layout) in the radio, since the antenna is tuned to the radios desired transmit frequency and the radio while in transmit mode is putting out the desired frequency along with the undesired spurious frequency which can be greater than the actual desired transmit frequency then the vswr detector responds to the approximate 13.5Mhz spurious frequency thereby turning on the radios high SWR icon. Has nothing tp do with cable losses or not. The SWR icon can and does come on when operting into an antenna that has less than a 1.2:1 VSWR. The SWR fix which addresses the grounding/poor layout design flaws eliminates the approximat 13.5 Mhz spurious Power amplifier oscillation.

Frank,

The issue is that the FT100D incorrectly sees a high SWR and internally reduces the output power from the radio or in the HIGH SWR ICON case shuts off the output altogether.

The problem is made worse with a bad ground in the mobile installation, but the root cause is poor internal grounding and shielding inside the radio which allows spurs to radiate and be seen as high SWR.

There are known fixes and reworks inside the radio and Yaesu has not been consistent with new production to make these changes permanent.

Subject: [FT100] Re: 2nd Menu Functions

The FT-100D is your basic "100 Watt PEP" rig on HF. It's
fan/heatsink system is designed to get rid of the heat that comes
from the difference in the input power minus the output power.
That's about (12x21)-100 = 140 Watts of heat flow. When you jack up
the output power beyond 100 Watts out you're going to do two bad
things and only realize one tiny good thing. The bad things are
a) the final amp devices will run hotter, thereby shortening their
life and b) the final amp devices will run at higher current than
they normally would which also will shorten their life. The slight
improvement you will get when you run, for example, 175 Watts instead
of 100 Watts output is 10log(175/100) = 2.43 dB increase in received
signal level versus running 100 Watts output. That's less than half
an S unit so it's a lousy trade-off. If you want a little louder
voice with the FT-100D do what I did and drive it into an SB-220 for
a full kW output. Now you have a 10 dB advantage. Even then it's
only about 1 1/2 S units. Still, 10 dB makes a major difference at

FWIW dealing directly with Phillips has always been notoriously difficult at best unless you are trying to buy huge quantities as part of a business. I've always dealt with a distributer in the past (though not for a few years). The prices are higher of course but still not bad.

As one who had to pay a fortune to get the part replaced I'd be delighted to get some spares. I'd like to see data sheets on the original and replacement parts first of course.

I can maybe chase my old distie for info. How many spares do people want? :-)

Subject: [FT100] V/U output transistor replacement

I got the following message from one of our list members who sent it to me directly. I don't know anything about the replacement part mentioned below, but it has come up as a question on the list before and certainly merits some investigation:

Dear Members

I have some very good news for you
I have discovered a replacement for the MOSFET /

transistor,
commonly reffered to as SRF 8043
used in VHF and UHF TX finals of the FT - 100
The magic replacement MOSFET is a BLF 546 - and has
a SOT268a case
just
like the SRF 7043
available from Phillips Semiconductors distributors
like "Arrow" and
etc.
at US$143.77
or if you buy 20, just over US$100 each
Ask me what they are really worth
Knowing Phillips they charge double to anybody else
for anything with
their
brand name stamped on it.
Phillips would make a profit if they charged about
US to US$8 each ,
and dearest part is the testing, packaging and
handling.

I know that you can buy the stuff from Phillips
factory quite cheaply
if
you are a big manufacturer and know ropes. Any
suggestions on this
topic
would be appreciated.

What's the SRF 7043 worth? about a $1
Now you are getting the hang of it

Yours truly Paulus - keeps on, keeps on saving people
money

The only good solution for the ATAS and any kind of pickup that I have found is the mount that you have attached to the rear of the hood by the windshield. I thought it would look weird when it was suggested to me but it looks much better than you would imagine. Besides, getting coax through the firewall is easier than through the back of the cab. Just be sure to ground your hood with a piece of copper strap.

# 13635. Re: ATAS makes my car shake?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-18 03:42:01 UTC
From: kc7gsg
Topic: 13623  Message: 13635

I don't have that problem with my ATAS (it's mounted on the top ladder rack of an E250 Ford cargo van, talk about a killer ground plane!) but I do find that I have to slow down under 50 MPH to change bands on it. I think the wind pressure is too much at high speeds and it binds up the screw drive. Other than that, it works great. I had a '91 Legacy Sedan. No ATAS on it but a great little car. Sold it with 140k on it and the original struts didn't shake a bit.

good luck
Sean

From: Alex Turner
Topic: 13607  Message: 13636

They indeed make two models, 1275 and 1275M one has an 8 pin DIN and the other has an RJ45,same as the mic plug on the FT-100, but I don't think it really matters since you will probably wind up using the miniature DIN on the back of the FT-100. All the signals are there and easier to get to than the mic plug. Other rigs will probably work fine with RJ45(modular).
I bought last week-end at the hamfest.

Michel,

The MFJ-1275 is the only Interface they make. If you were looking in their catalog and saw two, one was the front and one was the back. Be sure to confirm that the mic connector on the front has the same number of pins as your mic.

Hi,

Does anybody know which model of the MFJ Soundcard-to-Rig Interface should be ordered to work with the FT-100 ?
I bought a hand held microphone ( HMM ) from Heil and I have also got the AD-100 adaptor. I guess that the right model to choose in my case is the MFJ-1275 but I am not sure.

Subject: [FT100] ATAS makes my car shake?

See if this sounds reasonable...

I mounted my ATAS using a Comet 730 mount on the top right corner of my rear hatch on a Subaru Legacy Wagon (a '98, but with 120K miles, original struts). I had moved it off the luggage rack because I was getting a better match mounted directly on the metal lip. The 730 is a mid-size mount, not a full size. I don't have enough of a straight metal lip above the glass on the hatch corner to use a full size mount.

Last few weeks I've been noticing a shake in my rear end when I get up to 65, 70, 70+ MPH. Thought I had a tire balance issue, but noticed this morning when I drove in without the ATAS on, the shake is gone.

At 80 MPH, could the ATAS cantilevered off the back of my car start oscillating in the wind, and get my car shaking, especially with those old struts?

So how would we do that, would we get someone with a business, to help out, or should we ask Phillips directly and see what happens? Any ideas out there, I for one would like a few extras around the house. KA1FFO

Subject: [FT100] V/U output transistor replacement

I got the following message from one of our list
members who sent it to me directly. I don't know
anything about the replacement part mentioned below,
but it has come up as a question on the list before
and certainly merits some investigation:

Dear Members

I have some very good news for you
I have discovered a replacement for the MOSFET /
transistor,
commonly reffered to as SRF 8043
used in VHF and UHF TX finals of the FT - 100
The magic replacement MOSFET is a BLF 546 - and has
a SOT268a case
just
like the SRF 7043
available from Phillips Semiconductors distributors
like "Arrow" and
etc.

at US$143.77
or if you buy 20, just over US$100 each
Ask me what they are really worth
Knowing Phillips they charge double to anybody else
for anything with
their
brand name stamped on it.
Phillips would make a profit if they charged about
US to US$8 each ,
and dearest part is the testing, packaging and
handling.

I know that you can buy the stuff from Phillips
factory quite cheaply
if
you are a big manufacturer and know ropes. Any
suggestions on this
topic
would be appreciated.

What's the SRF 7043 worth? about a $1
Now you are getting the hang of it

Yours truly Paulus - keeps on, keeps on saving people
money

# 13640. Re: [FT100] High SWR

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-17 19:20:35 UTC
From: Paul Manuel
Topic: 8763  Message: 13640

Don't forget that if the band in question is 10 meters, we can expect about three times the loss that we experience on 80 meters. If this 24 watts heats the line, the losses will increase.
In actuality, probably most of us use 15 feet or so of cable to the antenna. So then we multiply our 24 watts by 1.5, to get 36 watts lost in the cable.
And this is not considering the loss in whatever we are using for a matching device, which can be a lot when matching a low impedance antenna.

I am not saying this will drastically decrease our signal, but it can be awfully inefficient on the higher frequencies.

From: backhoefade
Topic: 8763  Message: 13641

The whole discussion is academic when it comes to the FT-100D; it won't let you operate much over 2:1 SWR. Those finals don't want to see the high voltages that occur with large reflections and the SWR protection circuit achieves that goal. Guess sometimes you could say it's "frustratingly effective". Once you fix the spurious oscillation bug it's hard to hurt this little beast.

# 13642. Courtesy call

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-19 01:30:45 UTC
From: am_fm_radio
Topic: 13642  Message: 13642

Yaesu left me a courtesy call on my answering machine. They are shipping the radio back. I shipped it to them Mar 14th over night... So we're at 33 days and still waiting. But the claim is, it's on it's way... we'll see ...Murphy works for USPS/UPS/FEDEX...

ALL MODS DONE, speaker changed (it was distorting and "ringing" at moderate volumes) RIG checked out OK. The Tech stated. Mic gain and proper installation of the power cable is REQUIRED. He said straight to the battery.

My 2002 GMC Sierra 2500hd Duramax Diesel has 2 batteries.
Which battery do I use? Currently I'm connected to the "junction box" that GM recommends connecting jumper cables/chargers and accessories to. It's located right off the drivers side exaust manifold and is labeled- "Battery Connections inside" I'm also using the truck sheet metal to mount the radio to. Is the radio frame grounded like it should be?

I may re-do my power cables and connections. I mounted the rig in the truck in December in the cold. It's much warmer to work outdoors these days.

If anyone is interested, I remoted the control head into the overhead console. Looks as if it came from GM....

I had to rattle your chain a bit, Bill. I do that all the time. I still think 75 mph during rush hour is just too fast. But then I live in lazy Colorado springs where the Interstate is 2 lanes in both directions, the city fathers are fighting a light rail system and the City is now at 500,000 folks.

I doubt that the ATAS is causing the problem. I hope you find it's that bearing that is going south.

# 13649. LF monitoring

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-19 16:16:53 UTC
From: backhoefade
Topic: 13649  Message: 13649

I built up a 500 kHz low pass filter, stuck it in front of the FT-100D and snooped around last night. Heard about ten different CW identifying stations such as AK, SF, MOG, etc beteen about 278 KHz and 400 kHz. I believe those are navigational beacons. Can anybody point me to a website that lists the frequency and location for some of these nav stations?
thanks
Chas N6AF

# 13650. Low RX Volume on 2m

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-19 15:14:34 UTC
From: Abe Schachter
Topic: 13650  Message: 13650

I purchased an FT-100 and ATAS-100 for my car nearly three years ago and have been extremely pleased with the combination. The rig had the SWR mod performed a couple of years ago.

Recently, I've noticed that the RX audio on the 2m band has gotten low and the volume control needs to be set to maximum in order for me to hear it. Is this a known problem and, if so, can it be solved by fiddling with the IF gain settings in the second menu set or does it need to be sent back for servicing?

All suggestions are greatly welcome!

# 13651. [AD] Now Available: Direct Frequency Entry KeyPad for Yaesu/ICOM Radios

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-19 19:14:43 UTC
From: John Hansen
Topic: 13651  Message: 13651

Hi:

The direct frequency entry keypad that I've been working on for the FT-817, FT-100 and ICOM radios is finally available for sale, both in kit and wired and tested form.

The keypad performs a number of functions. First, of course, it allows you to directly enter frequencies into your radio. You can enter the frequency as either kHz or MHz and the keypad will figure out which you intended. Thus, to QSY to 14.254 MHz, you can enter either 14254 or 14*254. You can also omit any trailing zeros. Thus, to go to the bottom of the 40 meter band, you simply enter the 7 digit followed by the enter key. The keypad also knows which mode to switch the radio to. If you enter a frequency in the SSB portion of the 20 meter band, it knows to switch the radio to USB. If you enter a frequency in the SSB portion of the 40 meter band, it knows to switch to LSB. For the CW band segments it automatically switches to CW. Enter a 2 meter repeater frequency, and it switches to FM. Enter a frequency in the FM broadcast band (on a radio that supports this), and it switches to WFM. The keypad itself uses high quality full-travel (not membrane) keys and emits a pleasant beep whenever a key is pressed.

The keypad is designed to be operated from an internal 9 volt battery. It's power consumption is now so low (under 10 microamps when idling) that it should run for years on a single battery. A power switch, therefore, is no longer necessary.

Switching the keypad between radios is quite simple. To change the keypad to FT-817 mode, for example, simply type: **817 To switch to FT-100 mode, type: **100 To switch to ICOM mode, type **0XX where XX is the CI-V address of your radio. Thus the keypad can easily be carried from the IC-756 in your house, to the FT-100 in your car to the FT-817 when you go backpacking without missing a beat.

The keypad is available in a wired and tested version for $95 postpaid anywhere in the US. It is also available as a complete kit for $70. This kit includes all of the parts necessary to build exactly the same product that is sold wired and tested. The enclosure is pre-drilled so that no cutting or plastic work is required. The circuitboard has very few parts and makes an excellent beginner's kit. Step by step instructions are included. To build the kit you will need a soldering iron (30 watts or less) and a hot glue gun (the type that can be picked up a stores like WalMart for under $3.

More information on this product including a link to the assembly and operation manual is available on my website: http://john.hansen.net/keypad.htm

Thanks for the bandwidth.

# 13653. AntErr with ATAS100 when TUN is pressed.

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-19 20:45:22 UTC
From: Tabby Francisco
Topic: 13649  Message: 13653

Help!
Whenever I press TUN I get the AntErr message. What?s
wrong?

I read the manual. It never mentioned what the message
meant when an ATAS-100 is connected.

The ATAS-100 once tuned under the following condition:
- Only the center conductor was connected from the pig
tail to the coax leading to ATAS100.
- Radio not grounded (radio lying down on trunk).
- Menu 61 = ATAS-2

When the pig tail is securely connected I hear
nothing. When only the center conductor is connected,
I hear normal noise or reception. Can anyone explain
why? Looks like its better when only the center
conductor is connected.

Radio is powered with a 10gauge separate (+) & (-)
wire direct from battery posts.

The Diamond Trunk mount K400 is grounded good. I
soldered a ? inch braided wire to a metal strip that I
inserted under the K400. The strip is securely held by
the 4 allen screws. The braided wire is bolted on the
trunk and rear deck of my sedan. Bullet proof
grounding.

> Is this a known problem and, if so, can it be solved by fiddling with the
IF
> gain settings in the second menu set or does it need to be sent back for
> servicing?

1 Are you talking about SSB or FM? FM low audio on one band would suggest
a tone-squelch set by mistake. SSB low may indicate another problem, as you
suggest maybe an IF gain setting. But how did it go wrong? See below:

2 In either case, alignment is almost NEVER a repair technique. Alignment
settings don't usually "slip" although with software alignments being used
these days it IS theoretically possible that the data got corrupted in the
radio. Alignment is useful for after a component repair is done, of if you
have a friend with a very elaborate service generator and you want to make
it more perfect than the factory banged it out at.

No, I suspect a failure of some sort.

Thanks

To: FT100@yahoogroups.com
Subject: [FT100] AntErr with ATAS100 when TUN is pressed.

Help!
Whenever I press TUN I get the AntErr message. What□s
wrong?

I read the manual. It never mentioned what the message
meant when an ATAS-100 is connected.

The ATAS-100 once tuned under the following condition:
- Only the center conductor was connected from the pig
tail to the coax leading to ATAS100.
- Radio not grounded (radio lying down on trunk).
- Menu 61 = ATAS-2

When the pig tail is securely connected I hear
nothing. When only the center conductor is connected,
I hear normal noise or reception. Can anyone explain
why? Looks like its better when only the center
conductor is connected.

Radio is powered with a 10gauge separate (+) & (-)
wire direct from battery posts.

The Diamond Trunk mount K400 is grounded good. I
soldered a ¾ inch braided wire to a metal strip that I
inserted under the K400. The strip is securely held by
the 4 allen screws. The braided wire is bolted on the
trunk and rear deck of my sedan. Bullet proof
grounding.

>
>Thanks
>
>-Mike

Yes it does connect to the computer port. I do not know for sure whether this would work or not, but I suspect that it could coexist with the FC-20. It would be necessary to rig up some sort of splitter cable to do this. The keypad only transmits data to the radio, it does not use the CAT data coming out of the radio. So the only pin that would be an issue is the one where data goes in. I don't know whether the FC-20 uses this pin or not... it may be that it is only using data from the radio, but I suspect it has to send a "data request" on the data in pin in order to get the radio to send data.

So I guess the answer is that, at a minimum, it would be necessary to build your own cable or build a splitter. If you decide to order a keypad and find that it does not work with the FC-20, I would refund your purchase price. On the other hand, if it does work, you could probably go into the splitter manufacturing business.... but that's another issue.

Thanks for the inquiry.

# 13663. Re: [FT100] [AD] Now Available: Direct Frequency Entry KeyPad for Yaesu/ICOM Radios

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-20 19:14:58 UTC
From: John Hansen
Topic: 13651  Message: 13663

I picked up my Yaesu manual today and I think I may have a better answer to your question. The ACC jack on both the FT-100 and the FT-817 perform a variety of functions (I guess this is one of the things that makes the radios so small). My keypad uses only the pin that sends data to the computer port on the radio (plus ground). My guess is that the antenna tuners that plug into this jack are using the band data pin. If you are using an accessory that takes one of the other pins (like band data, or PTT or whatever) I'm virtually certain that there will be no conflict between these devices and the keypad. The only problem is that you would have to do some surgery on the cable that plugs into the ACC jack. The cable that I supply brings out wires for all of the pins on this jack. I use the ones for data in and ground (ground could obviously be shared) but the rest are trimmed at the keypad connector. Thus you could make use of those wires at that point.

One other thing that may be of interest. The pin-outs for the CAT interface in the FT-100 manual are wrong. The data in and data out pins have been reversed. Interestingly enough, the same thing is true on the manual for my FT-736. My guess is that this happened as a result of a language translation problem. This problem cost me a fair amount of money because I mistakenly believed I'd damaged Pres Waterman's radio and sent it to Yaesu for repair. I have not checked the accuracy of the other pinouts for this jack, but I would no longer assume that the manual is necessarily correct!

John W2FS

PS. I should have mentioned in my previous e-mail that I'm deeply indebted to Pres for lending me his FT-100 so I could design this keypad. In addition, Pres has spent a fair amount of time on beta-testing and providing me with a detailed bandplan for automatic mode switching. Without his assistance this project would either have been very much delayed or might have never been completed at all. Thanks, Pres!

Not DCS
Not attenuated by a tuner.

# 13665. does the ATAS use the band data pigtail?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-20 19:44:29 UTC
From: jondickason
Topic: 13665  Message: 13665

Hi all. I just got a used ft-100 and ATAS-100. page 31 of my manual says the band data pigtail is used for the fc20 or ATAS. I think this is an error, but I didn't get any docs with the antenna, and no cable to somehow connect this pigtail to it.

I haven't gotten the antenna motor to activate yet, but haven't finished grounding everything yet. I also receive lousy on HF so far. It says it's tuning and transmit comes on for a minute, but no motion. If I put a voltmeter at the antenna output should I read the DC voltage that powers the antenna?

Thanks and 73

I'll answer this as John may not be familiar with the FC-20.

Yes, it connects to the same "ACC" port as other CAT-controlled devices. So, yes, a choice must be made between the QSY'er ( or any CAT device ) and the FC-20 antenna tuner.

Actually, I refer to the FC-20 as an antenna "trimmer"... it does not have the range that other, non-integrated but fully automatic antenna tuners have. Bottom line, consider another tuner, if possible, like the LDG, for other reasons as well as the CAT conundrum mentioned above.

Good ground at antenna and rig is _very_ important.

> It says it's tuning and transmit comes on for a minute, but no
> motion.

There is a menu setting on the FT100 that has to be set to tell it you have an ATAS, and whether you want to use it for HF only, or HF and V/UHF. Depending on how old the FT100, the manual may actually be wrong about the setting. I would recommend reading through Lee's FAQ.

http://www.k0lee.com/ft100faq.html

If I put a voltmeter at the antenna output should I read the
> DC voltage that powers the antenna?

12V going one way, 8V going the other. You should also be able to move the antenna by manual tuning: Put the rig in SSB mode, press and hold the mic PTT in, and press and hold the Up and Down keys on the faceplate (NOT on the mic). The antenna should move in that mode.

Report back your results, and if still no go, I can walk you through a check of the ATAS.

Date: 2002-04-21 00:13:45 UTC
From: Peter van Daalen
Topic: 13661  Message: 13670

I am about to buy such a small 7-21 Mhz hiQ loop.
But, with respect to the price out here ( over USD 600 !, is it worth this money ? ) I have a few questions ( I know a bit of the small loop theory ).

1. Does it make sense to mount it elevatable ( from horizontal to vertical with an AzEl rotor ) ?
2. If I will use the horizontal radiation ( with a 15 degr. tilt ) , but cannot mount the loop more than 10' above the flat roof of the building with [concrete] reinforcing steel " ground "..! ), how badly will the horizontal radiation be deteriorated by this " ground " ?
3. Is the Q of such a small ( motorized tuned ) loop ( 38" diam ) high enough to replace a preselector ?
4 Could somebody give me an idea of the -3db bandwith and skirtshape of this small loop ?

I'm grateful for any help.

These are aviation NDBs (Non-Directional Beacons). They are low power navigational beacons used for non-precision approaches at low traffic airports.

NDBS are also commonly co-located at the outer marker (approximately 5 miles out) on an ILS (Instrument Landing System). An ILS is a precision approach used at medium and high traffic airports.

Most of the time they only transmit a two-character CW identifier. The one at my airport (KVPZ) transmits a CW VP on 212 kc and is located on the ILS for our runway 27. Larger airports may have more than on NDB.

At selected airports there are AM broadcasts of ATIS (Automatic Terminal Information Service) that can include current local weather and airport operational information, or aviation NOTAMs (Notices to Airmen).

Years ago NDBs were also used for enroute navigation in the US lower 48. The enroute NDBs are much higher power and more easily heard. I still see enroute high power NDBs used in Canada, Alaska, and New Zealand. Enroute NDBs are also still in use in most other countries of the world. Other than one at your local airports the enroute NDBs are the ones you are most likely to hear.

I have a US NDB listing in handbook form. Because of it's size it is
almost impossible to put on a copier. NDBs are also shown on US aviation approach plates, enroute charts, and sectionals. NDBs are also stored in my aviation GPS. Unfortunately I have no easy to convert any of these to electronic form. I'll look around and see if I can find a US NDB listing anywhere in electronic form or on the Internet. I assume you want them sorted by frequency rather than by location.

As a side note, the US Air Force plane that crashed in Bosnia killing Ron Brown (the US Secretary of Commerce) was shooting a dual NDB approach. He missed the airport and hit the mountain instead.

This is really off topic of the FT-100. If you want any additional information contact me direct. If I find any electronic listing I will send it directly to you.

I use mine mounted vertically (standing on end) about 4' off the ground.
Actually I have the 10 - 30 MHz version. But at 4' off the ground it is with
in 1 S Unit of my 20 meter 1/2 wave dipole that is mounted at 20'.

If you are going to be below 20' they recommend mounting it vertical.

Hi Bob,

1. Tune to a frequency with a local radio station in the broadcast band
2. Push MODE until you see FM in the display
3. Push and HOLD the MODE button until the readout in the display changes from FM to WFM

This is the same as switching from LSB to USB.

73s, Peter

Subject: [FT100] No wfm?

I have a new ft100d purchased a month ago. Has the mods done. I cannot recieve wfm stations All i get is a few squeals in the fm brodcast band. Now before you ask, I have tried different locations and yesterday I went to my brothers house who also owns an ft100d and side by side his picks up wfm fine and mine wont. Any ideas? I really didnt buy the radio for this feature but was wondering if it is a clue to other possible problems. It works great on 2 meters fm and all hf bands. Bob

Go to http://www.airnav.com/navaids/
You can request the information you want one entry at a time.

Also you can go to http://frodo.bruderhof.com/ka2qpg/
There you can download three files called "frequency" or "identifier"
or "geographic name". These are the US NDBs sorted three diffferent
ways.

Hi Peter,

MFJ quotes USD 430 on their site.
In Holland I'll have to pay EU 703 ~ USD 608 indeed !
( I guess shipment/insurance, importduties, VAT etc. raises the USA price noticeably).
Or does my outlet try to become a millionaire overnight ?

Too bad for me, I'll have to pay over USD 600....
( BTW : when you happen to come over to PAland please take one for me with you...:-)

Peter, PE1ECM

This is the real clue look for a cold solder joint on the coax.
Since the DC feed to the ATAS is via the coax it isn't going to
work with a bad connection. Louse reception also sounds like a
coax problem. Grounding while important will not make up for a
bad coax.

Jerry who has used hundreds of miles of coax.

From: Alvin M. Norris
Topic: 13650  Message: 13685

I had the same problem with the recieve audio around the first of the year. I called yaseu and asked if I should try a specific reset. The said yes I should and that I should have read my manual instead of calling them. Before I could do the reset the radio healed itself, which bothers me because I still don't know what the problem is or was. I had suggestions like checking to see if it was in wfm or checking the speaker. But again it straightened up before I could check everything out. If you do find out what the problem is , Please post it Alvin Norris

> servicing?

1 Are you talking about SSB or FM? FM low audio on one band would suggest
a tone-squelch set by mistake. SSB low may indicate another problem, as you
suggest maybe an IF gain setting. But how did it go wrong? See below:

2 In either case, alignment is almost NEVER a repair technique. Alignment
settings don't usually "slip" although with software alignments being used these days it IS theoretically possible that the data got corrupted in the radio. Alignment is useful for after a component repair is done, of if you have a friend with a very elaborate service generator and you want to make it more perfect than the factory banged it out at.

No, I suspect a failure of some sort.

Thanks for the info. One of the other guys gave me a URL with a pile of NDBs. If you find more let me know. The April QST article for a LF upconverter sparked my interest. So I built up a simple low pass filter with a cut off around 400 kHz and stuck it on the 100D. Heard a few stations.

Years ago I built an upconverter and a little transmitter for 172 kHz. Tried and tried to talk across town (about 4 miles) to a Ham buddy but no luck. About the best I could do was a few hundred feet. Now things would be different. Didn't know how to approach the antenna matching issue back then, but it was still pretty interesting to be transmitting down there among the power line harmonics. If I ever pursue this I'll set up a decent antenna system, and probably get about 0.5 mW ERP!

Looking at the schematic in the Service Manual one can see that the receive IF signal is steered through an L-C type filter when operating in FM mode. (That L-C filter is used when operating AM if you haven't installed the 6 kHz filter).

You might want to step through all the settings in your brother's rig and compare it to yours. Maybe one of of the filter selections is set up incorrectly.

Thanks guys! I actually called Yaesu Technical Support last Friday. I was put on hold for only about 2 minutes. Not bad. I gave them the setup and what I was experiencing. The tech person immediately said a shorted coax. Never thought a shorted coax, as it was a new coax that came with the new Diamond K400c. After testing with my VOM, Yup, it's shorted alright. The short was at the pl-259 side. Brought it back to HRO and they replaced it. Good. kc2ekv/6 p.s. thought it was the radio as we had too much talk about factory defects on the radio, that I immediately blamed the radio. --- K4IA@... wrote: > Sounds to me like a short in the coax. It sounds like a shorted feedline and/or coax connector. Try putting a dummy load on instead of the ATAS and see if you get the same error...

Subject: AntErr with ATAS100 when TUN is pressed.

Help!
Whenever I press TUN I get the AntErr message. What's wrong?

I read the manual. It never mentioned what the message meant when an ATAS-100 is connected.

The ATAS-100 once tuned under the following condition:
- Only the center conductor was connected from the pig tail to the coax leading to ATAS100.
- Radio not grounded (radio lying down on trunk).
- Menu 61 = ATAS-2

When the pig tail is securely connected I hear nothing. When only the center conductor is connected, I hear normal noise or reception. Can anyone explain why? Looks like its better when only the center conductor is connected.

Radio is powered with a 10gauge separate (+) & (-) wire direct from battery posts.

The Diamond Trunk mount K400 is grounded good. I soldered a ¾ inch braided wire to a metal strip that I inserted under the K400. The strip is securely held by the 4 allen screws. The braided wire is bolted on the trunk and rear deck of my sedan. Bullet proof grounding.

Looking at the schematic in the Service Manual one can see that the receive IF signal is steered through an L-C type filter when operating in FM mode. (That L-C filter is used when operating AM

Diamond must be having real crummy quality control. I bought a Diamond universal mount for my 4-runner along with the 13 foot of mini 50 ohm coax/uhf base adapter to adapt to my 6 meter antenna on Saturday at HRO and I found the center conductor on the mini UHF female plug end was intermittent. I spent about half an hour of troubleshooting it, you know the routine moving it from the rear hatchback to the front hood and then back several times, all which by the way is bonded with braid, all of the time continuously swearing at the darn FT100D then I finally borrowed a DVM and confirmed that the center conductor on the crappola Diamond mount was intermittent. Once the open coax is repaired the FT-100D works excellent, just like it did on my other car. Like I said, once the old way of grounding gives up the ghost, the problem will most certainly rear its ugly head.. Its good that you put some heavy use on it as this problem usually manifests itself later on if not from the get-go. Its pretty much related to use as the heat generated from within loosens the existing bond that the copper tape has on the center rib. So once again I will reiterate and inform those that think they have the one that doesnt need any modding, here is your proof.. Enjoy now.. Pay later.. Regards.. Richy N2ZD

Hi Greg,

Almost any SWR/Power meter should be OK as they always provide a direct path
from input to output and just sense what is going on in it RF wise.

I don't know if it is bad QC or bad design, I have a CQ-5M mount which uses a female UF at the mount, RG-174 ( thin ) to 5D2V ( thick ) to the rig. I have has to unscrew the 3-screw cover on the bottom of the M/UHF female socket and resolder it a few times. Now the screws are rusty to boor...:(

I bought mine at Ham Radio Outlet. I think it was about 35 bucks.

They may be cheaper if you buy direct from the Yaesu service center.

From: jondickason
Topic: 13665  Message: 13700

Thanks W6JH and the rest. I grounded the radio, the rear door (antenna is on the SUV's spare tire mount), and replaced the coax. The ATAS is now tuning with good SWR. My receive is really noisy with the engine running, and not just the usual engine noise. But now that the antenna seems ok, I'll happily play with dsp settings and what not, and probably try some noise filters on the power line. Thanks again.

Could be better! Time owned: 0 to 3 months
I was looking for wattmeter for YAESU FT-100D with ATAS-100 antenna.
Since antenna has automatic tuning, it will not work with all
wattmeters. Well, I thought that YAESU works better with YAESU. I was
wrong, YS-60 has zero resistance between the center pin and the
ground. So, it completely disable automatic tuning. It has no other
disadvantages though.

What do you make of that?

# 13702. FT100 in Ford Ranger

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-24 02:27:57 UTC
From: Kevin Burkhart
Topic: 13702  Message: 13702

I have been reading this list with interest for a while now, thanks to everyone for the thoughtful posts.

I just came upon a good deal on a new Ford Ranger. I have heard of the RFI problems that Ford has with their trucks. Does anyone have experience with using the FT100 in a new model Ranger? Any problems I need to anticipate in advance?

I would also be delighted to see photos of your Ranger install as well.

Thanks and 73,

Kevin,

I have my FT-100D in a 2000 Ford Ranger pickup. I took some pictures a few weeks back, but I haven't made them available yet. I will try to do that in the next few days and post the URL. And I'll upload them to the YahooGroups photo area.

I haven't had any problems with mine. I used to have the ATAS100 mounted on the hood right by the drivers side, but I moved it after I had to take the antenna off for a while. In the meantime, I got a bed-toolbox made of aluminum, so I bolted a bracket with a 3/4" hole to the toolbox, behind the driver. That's where I mounted the ATAS100 and it works great. I have yet to ground the toolbox to the frame, but I have a strap to do that soon. In any case, it tunes 6, 15, and 20 meters for sure. I haven't tried the others with this new antenna location

Pictures soon!

# 13705. RE: [FT100] ATAS on 99 Suburban ?

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-24 04:33:41 UTC
From: K2TFC
Topic: 13606  Message: 13705

Jim,

94 sub owner here...

Over the passenger side rear tail light is the plastic end cover.

This end cover comes off with a few screws.

There is a vent hole where easy entry for the coax is ( again.. the little plastic diaphragm flap unscrews...

Once the end cover ( better than a foot tall )is off you see a nice hunk of metal atop the housing for the rear tail light ( passenger side ).. So here you have a nice flat mounting area to screw down to.

I mounted the semi flat part of a diamond or comet hinge style so-239 mount on it....it sticks out to the side of the trunk only 1" to 2"

the mount works great...I can take pics if ya like....

last... I got a rubber neoprene flashlight holder that slips over the base of the atas-100 below the billows.

this has a little clip that I use to clip to the almost top of the end cover once re-installed. This provide some great strain relief...the neoprene sleeve is forgiving..

only modification to the end cover is nibbling about 1/4" of the plastic of the bottom of the cover right above the protrusion of the bracket. its a very clean install.

Tom

I am assuming that by skirt steepness you are describing the bandwidth of
the antenna once tuned.

My antenna is around 20 KHz wide on 10 MHz to 40 KHz on 29 Mhz. It is quite
narrow but just a touch of the controller will tune it right back up.
according to the MFJ 259B it will tune from 9.785 MHz to 30.450 Mhz.

# 13707. Pre purchase inquirey

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-24 02:10:28 UTC
From: ke7mh
Topic: 13707  Message: 13707

I have the FT 817, which I like very much. Now I am looking to buy a little hefter rig and have been looking at the FT 100D. However, I see many many notes from the over 1900 members about basic problems with the rig that ought to have been corrected by now.

So my question is this. Can someone reasonably expect to purchase a new FT100D and expect that it will work out of the box, without some of the major design propblems that have been discussed on this site?

If not then Yeasu may loose a potential customer.

Thanks in advance for any replies.

de Mike KE7MH, Western Washington.

Greg

I use the Diawa cn-410M cross needle mobile meter with my FT-100
It passes the 12v fine. A big advantage is that you can see the
reflected and output power and make manual adjustments as needed.
Rarely does the ATAS 100 need additional manual adjustments.
I just received a new AES catalog and they show them as
discontinued but have them in stock.

Topic: 13707  Message: 13709

Hi Mike,

I can understand your anxiety. I own a Yaesu FT-920 and less than a week after I bought it, I turned it on one morning and the A VFO was blinking and the receiver was dead. I did everything suggested and nothing helped. I called HRO in Denver where I purchased it the prior Saturday and they had me bring it in (I live in Colorado Springs, 65 miles south of Denver) and they replaced the unit with another one and I've not had a problem since.

I bought a Yaesu FT-100D about a month ago and have read all the same stories you have read. I, like you, was wondering if I had made the right choice for a backup HF rig and a mobile rig. Well, so far I have been very pleased with the FT-100D. It is a great little radio. I haven't had a single problem with it and if I had to do over again I'd most likely buy one again.

I think you have to do the research you are doing and then make up your mind. I did that on the 920 and the 100D. I came to the conclusion that there is no "perfect" radio anywhere in the world. One person will have problems and another won't. Kind of like cars, and they cost a helluva lot more than radios. Not only did I research the 920 and 100D, I also researched the ICOM comparable rigs as well as Kenwood entries into the market. I have held my ticket for 40 years and have owned all of them, plus Heathkits. With the thousands of radios being sold, there will always be a certain percentage that have little bugs in them. Kenwood has 'em, Icom has 'em and Yaesu has 'em.

I think only you can come to the right decision for you, but don't let a few negative comments deter you from buying the FT-100D. For it's size it packs a lot of punch. And, if you like your 817, you're going to love the 100D.

I'll be interested in hearing what you ended up buying, Mike. Happy hunting and researching.

73,

Dick

Subject: [FT100] Pre purchase inquirey

I have the FT 817, which I like very much. Now I am looking to buy a
little hefter rig and have been looking at the FT 100D. However, I
see many many notes from the over 1900 members about basic problems
with the rig that ought to have been corrected by now.

So my question is this. Can someone reasonably expect to purchase a
new FT100D and expect that it will work out of the box, without some

of the major design propblems that have been discussed on this site?

If not then Yeasu may loose a potential customer.

Thanks in advance for any replies.

de Mike KE7MH, Western Washington.

I'm looking at Ford Rangers and have pretty much decided on the V6, 4 liter version. I will install the FT-100D in it.
Can you tell me what to look for in a used Ranger; other than the 4 liter engine which I believe is the best performer. Do you know if the stock alternator is sufficient to run the FT-100D. Could it handle another 80 Amps or so for an ALS-500?

Hi, and thanks for reading this question. Okay, regarding the mic. mod., I have done it, and it was easy. Thanks to all who have written about this mod. I was wondering about the small, hard, round, plastic piece that falls out from behind the mic. I guess it is called a baffle? Anyway, I understand that, as with most things, automobile engines, computers, etc., all (or most, haha) parts are needed to make it work properly. But do I really need this baffle? Will it hurt anything if I leave it out? I have a feeling that I should just leave it there. Is this baffle used for sort of "blocking" air from when you talk or something? Sorry for such an odd question, haha. Thanks, though.

Hi Adam,

Well, I did the mic mod and when I got to the baffle I left it out. I'm told by those that know my voice that the audio was much improved. That may or may not be the case with everyone. Leave it out and keep in in a desk drawer. Then, a few years from now you'll find it and ask yourself "what the hell is this?" Then you can throw it away as another pack rat thingy that was saved and you can't remember why. :)

Be sure to use a sewing needle and puch out that 3rd blocked hole.

Why go to Yaesu with the mods if the radio is working OK. Wait until you have a problem, which may never happen. They say the turn around time is like a couple of months on the average.

# 13720. Mods, Ect

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-25 04:25:36 UTC
From: ftbratton
Topic: 13720  Message: 13720

Mike,

I have a two year old FT-100. I sent it to Cerritos to have the SWR mod and the fan mod done. It has been perfect since then. I use it hours every day with the ATAS. I am a salesman and am in the car off and on all day every day. The ATAS is taken off the Diamond K-400 mount at least once a day due to the garage and some areas my printers are in that are prone to vandalism. No ill effects in 21/2 years.

I found a good buy on an ICOM-706MKII at the local ham store. It was used but in excellent shape. I just had to know if I liked it as well as the "100". Having no equivalent antenna to the ATAS was quite a negative, in my opinion. I kept it two weeks and found out what I should have known but had to learn for myself-------it "ain't no FT-100"!!!!!! Finally accepting the obvious, I traded it in on a second FT-100. Point being------there isn't anything out there to compare to the ATAS-FT-100 combination.
I have an Kenwood 870, Kenwood 850, Icom 746 at base and I woudn't suffer that substantially if I only had the "100". I play with it next to the others hour after hour and am shocked at how close it comes to them. In fact, the 746 hasn't got a thing over the "100". The other two certainly do but not night and day. Most of the amateur radio community out classes their antennas with radios so badly it isn't funny. I'm certainly guilty of that-----but trying to keep that in mind at my own station.
My son graduates from Syracuse in two weeks and I'm getting him one for graduation. I was going to get my girl friend one but she just bought herself an Icom 756 ProII. I guess that is the only reccomendation I can give it.
The advice to leave it alone without mods until it gives you a problem is extremely bad advice as far as I am concerned. If the mods aren't done, you will have an swr problem that can badly damage the radio and it certainly isn't going to stay cool enough if the fan doesn't come on during VHF-UHF recieve. How smart do you have to be to know what an overheated rig can do? It gets so hot you can't rest a finger on it. My original one did and the newest one did too. I did the out of band mod for AF MARS and the grounding and fan mods. They are relatively simple. Cerritos kept the first one close to if not three full months. If you aren't comfortable doing them, you shouldn't have trouble finding and "elmer" to guide you if you are in a area active with amateurs. You might be one of the fortunate ones that are ok without mods but why take a chance. I paid sixty dollars for the mod out of warranty but it did take a long while to get it back.

Hope that is of help. Good luck with your decision. This is a great support group and I'm not sure I wouldn't even advise you to take that into consideration-----we all need help and advice from time to time and if you don't get it here you aren't going to find it anywhere else------that I'll bet on!!!!!!!

Freddy

My only comment about the mods would be that if you have any reasonable technical ability, do the mods yourself. They will take you less time than it takes to pack it up and send it off and with the amount of time it seems to take in the US to get it back.....

You should expect to have to do the "fan mod" and quite likely
the "spurious oscillation" mod. Those mods are best done by Cerritos.

# 13722. Short RX Time on 2m FM

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-25 06:20:29 UTC
From: Robin Midgett
Topic: 13722  Message: 13722

Hi,
I'm a FT-100D newbie...so far I like the rig, but I have much to learn.
One odd peculiarity I have found is that in 2m FM repeater service the rig seems to stop receiving the repeater abruptly. Tonight I IDed on a local machine, someone responded but the 100D RX shut off before the other person finished IDing, within 2-3 seconds. I know the repeater is functioning normally with a 5+ second hang time. I observed the same behavior on other 2m machines also.
On 70cm FM I did not encounter this problem.
One other question; in VFO mode I see "M" and "T" in the upper left of the display....what are they indicating?

Thanks & 73,
Robin Midgett KB4IDC
VHF+ Glutton, /Rover & fixed station EM66se

What does the green LED over the main tuning knob do?
How high is your squelch setting?

>
> KC5QFE
> Adam

Hi Adam,

When I first posted the mod here, I did it and simply turned the baffle to make the flat end align with the holes on the mic face along with adding the third hole. Chas N6AF went one step further and tossed the baffle in the trash.. Either way it works well. I am still getting emails from hams on how well the mod works, and best of all its simple to do and requires very little know-how.. If you are afraid to discard it, simply turn it after making the hole in the mic face and align the baffle so that the three holes in the mic face have maximum exposure to the mic element.. Regards.. Richy N2ZD

# 13725. FT-100 on the fritz

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-25 13:49:47 UTC
From: dabon8r
Topic: 13725  Message: 13725

Greetings group,

My FT-100 just went on the fritz last week. I was tuning up through my AT-11MP tuner on 18MHz when the tuner popped and something inside it fried. I took the tuner out of the line and hooked up the -100 direct to my antenna (which is resonant on all BUT 18MHz), but the -100 doesn't receive or transmit on any band, including VHF/UHF. When I move up and down from band to band, the band change relay doesn't click anymore either.

Anyone have any ideas about what I might have fried? I'd like to know if it might be something simple before shipping it off to Yaesu for repair (thank God it's still under warranty).

Thanks in advance.

David, KC0JB

# 13726. Info On MH-48 Mike

Yahoo group: FT100 (2002-01 — 2002-06)

Does anyone know if the Yaesu MH-48 mike will work with the FT-100 ?

Thanks, Dick, W1KSZ

# 13727. Re: Mods, Ect

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-25 15:53:48 UTC
From: backhoefade
Topic: 13720  Message: 13727

Can you tell me specifically what it was that you didn't like about
the 706, other than the fact that it doesn't have an ATAS-100 type of
antenna. (You can run the 706 with that antenna using a special
adaptor by the way).

I bought the FT-100D over the 706 for six basic reasons:

1) better front end overload performance
2) better adjacent channel rejection
3) variable bandpass filter DSP (mainly for CW but great on SSB too!)
4) better noise blanker
5) receive capability above 460 MHz
6) better "look and feel" (very qualitative but true for me)

So I was hoping you could share your experience with that 706. Was
the receiver performance relatively poor; if so, how so? Etc.

Thanks - I was considering picking up a used one to do just the same
comparison you did.

My only comment about the mods would be that if you have any reasonable technical ability, do the mods yourself. They will take you less time than it takes to pack it up and send it off and with the amount of time it seems to take in the US to get it back.....

You should expect to have to do the "fan mod" and quite likely the "spurious oscillation" mod. Those mods are best done by Cerritos.

Hi Lance. Very nice setup you have there, but isn't the antenna a bit directional? I hade mine mounted the same way but all I could hear was to the rear of my trk. Then I mounted it on a headache rack just about cab-top in height and it works like a champ. 73 Jim AD6DW

I had Cerritos do them on my FT-100D but you can get a good idea how to do it yourself from the multitude of photos and discussions here. Look in the Photos and Files sections for the spurious oscillation mod info. There have been numerous postings about the VHF/UHF fan mod. Cerritos actually installs a temperature sensitive switch that makes the fan operate on VHF/UHF just as it does on HF. But most people who do the fan mod themselves go the simpler route of adding a resistor that always keeps the fan turning at slow speed in receive mode. You can probably dig up one of the old postings about the resistor approach by entering a key word in the search function here.

# 13734. Re: Pre purchase inquirey

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-25 20:22:12 UTC
From: backhoefade
Topic: 13707  Message: 13734

There's also some mod info and operating suggestions at www.mods.dk

# 13736. Re: Pre purchase inquirey

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-25 22:16:54 UTC
From: backhoefade
Topic: 13707  Message: 13736

There's really nothing to "understand" here. Either your fans turn on automatically when the rig warms up during long receive-only periods in VHF/UHF operation, or they don't. Since you said your rig is around 2 years old it definitely isn't going to cool itself when receiving on VHF/UHF. I know a lot of people just live with them that way but in my opinion it's not a good idea to let all those devices inside there "cook" away unneccessarily. It will certainly shorten the long term lifespan of some of the semi-conductors. Some people have stated that they observe the receive sensitivity degrade when the rig gets warm so there's another reason to run the fans. Even though I have the "Cerritos fan mod" I experimented with the added resistor and found that a fairly high value like 150 Ohms let the fans spin moderately but not so fast as to be terribly noticable even when receiving weak signals without headphones. I may still put that resistor in there. I have worked with radio electronics all my hobby and professional life (22 years design engineering in telecom) and, trust me, you want to keep things nice and cool. So you might try the resistor approach but just use a value around 150 Ohms so the fan noise is kept down. There's a good photo of that resistor mod at www.mods.dk

I also posted some info there about AM operation of the FT-100D that might interest you if you are so inclined.

# 13737. RE: [FT100] Re: Pre purchase inquirey

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-25 23:49:03 UTC
From: Eric van de Weyer
Topic: 13707  Message: 13737

Hi Jim,

at the bottom of each message is a list of addresses including the list
owners FAQ one ( http://www.k0lee.com/ft100faq.html ). If you go to it you
will find all the info you need to do the mods there. That's where I got it
from to do mine.

73....Eric VK2KUR.

Hi Eric. Can you please lead me in the right direction as to find out how
to do these mods. The SWR and the fan mod. I can do them myself if I knew
where to go and what to do. Thanks in advance. 73 de Jim AD6DW

Subject: RE: [FT100] Re: Pre purchase inquirey

My only comment about the mods would be that if you have any reasonable
technical ability, do the mods yourself. They will take you less time
than
it takes to pack it up and send it off and with the amount of time it
seems
to take in the US to get it back.........

You should expect to have to do the "fan mod" and quite likely
the "spurious oscillation" mod. Those mods are best done by Cerritos.

Jim,

I haven't really noticed much directivity of the antenna. yes, the cab
blocks some of the signal, but the whip is mostly above the cab height.
I am sure that the top of the cab bounces some of the energy skyward,
but then, that's good for high-incident-angle sky-wave propogation.

I can be listening to a frequency and make turns on the road without a
noticeable change in reception clarity.

# 13739. ATAS-100 and '95 Mazda 626

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-25 17:40:43 UTC
From: kayakor
Topic: 13739  Message: 13739

Hello and THANKS For Reading!
I installed my FT-100D between the front two seats on a humpmount and grounded the radio to the large bolt holding the seat to the floor, scraped for a good ground.
As for the ATAS-100, it is mounted with a large lip type mount on the front edge (middle) of the trunk deck. For grounding I used a star washer and placed this below the barrel mount with a piece of galvanized stranded wire soldered to it and then grounding it to the large bolts holding the rear seat belts in place. The match is good but on all but 6mtr. On this band the match is best at about 53.0-53.5 or so, about 3 bars showing for SWR for the lowest reading. Any ideas for lowering this or is this about as good as it gets?
I have the galvanized grounding wire wrapped around the trunk swing arm a number of times then going to the seat belt bolt, also scraped and paint free.
Any and all ideas welcome!
Thanks in advance for all of your time and ideas!!
73
Mike

# 13740. Recent DC issues

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-26 03:04:46 UTC
From: kc0jao
Topic: 13740  Message: 13740

I have not been paying close attention to the postings recently, but I noticed some exchange about SWR meters and, more concerning, DC passing Diplexors. It has made me think about the VHF/UHF finals issue. Is it possible that the DC voltage from the HF antenna coax connector (meant to run the ATAS 100) is getting through the "non-Yeasu" Diplexors that some of you are using, and causing the UHF/VHF finals to "HEAT" in receive mode? This would certainly be an answer to why these finals are burning up on some of you. (I am assuming that there is not a dc block at the UHF/VHF output.) I would be interested in hearing if this is an issue or not.

*snip*
However, I see many many notes from the over 1900 members about basic problems with the rig that ought to have been corrected by now. *snip*

*snip* So my question is this. Can someone reasonably expect to purchase a new FT100D and expect that it will work out of the box, without some of the major design propblems that have been discussed on this site? *snip*

BUY A NEW ONE? Mike thanks to this group, you can buy a near new one cheap, from somebody this group has scared off!
I bought my FT100D from a man who had it two months, He said it had the "spurious oscillation" problem and needed to be sent to Yeasu. I bought it from him for $600.00. When I got it, the bracket was unused, the protective film was still on the display, and the original power cord was unused (as was the manual..suprise suprise).

I also got my ATAS100 antenna from a different man for $100.00, because it "would not tune very often" and wasnt as good as a "screw driver" or "Ham Sticks". Guess what, I installed them both in my 2000 Silverado Extended cab, just as I got them, and they both worked like a dream! The antenna tunes everything from 40 meters to 70 centimeters, every time. I think I like the radios performance better than my brand new Icom 746. However, when I had it indoors playing with it on my Beam antenna, I looked inside and found that all the screws were loose on the PCB's. I tightened them and did the simple mods this group is so fond of. (They certainly cant hurt anything). If I were you, I would not hesitate to get one of these fine radios. With the ATAS100 you cant beat it for mobile use!
Just make sure you INSTALL it, you'll have to drill holes in your car, and you might mar the paint, but it will work great, If you choose to use the "temporary" third party antenna mounts, and are afraid to scrape paint and drill in some GOOD grounds. I'll be looking forward to reading your "failure" posts in the future!
Happy Hunting!

From: kb3bmt@juno.com
Topic: 13707  Message: 13744

I thought basically the same way, i bought a new rig at a reputable store. These mods (if necessary) must have been done . . . RIGHT?

This was my last post to the group. I believe it fits in well here:

Well, I packed up my FT-100D (Serial 1Ixxxx) and sent it to the Yaesu Hospital today. It was good while it lasted. I made 400+ contacts, 33 countries, almost 300 counties . . . all mobile. I then started getting the intermittent high SWR problem and resulting power reduction. Antenna tuned good (less than 1.5:1 across the band). Did the same thing into a dummy load, so I figured it was time.

Since I had just purchased the rig new from HRO in January '02, I assumed that Yaesu had completed all the necessary mods before sending it out for retail sale. My excellent results over the past couple of months reinforced my thinking. But then the gremlin set in.

So, I pulled it out of the car and popped open the case. NO MODS! Didn't look like anything shown in the group's photos for the SWR mods. No copper tape, no grounding straps, no nothing. Man was I disappointed.

I asked Yaesu to do all the mods while they had it checking out the SWR problem. After all, it is under warranty.

I have an FT-747GX I think I'll stick in the car until the return of my old friend. The noise blanker is not nearly as good, but I really like having a rig in the car (I'm a service tech and drive 1500+ miles a week).

Sure am going to miss the old girl. But I know when she returns, she will be better than new.

I would be amazed if there isn't a DC block prior to both antenna connectors on the FT-100D. If there isn't one on, for example, the VHF/UHF output I can assure you that there is one less design engineer employed at Yaesu.

There is no "SWR problem", per se, for them to check out. The SWR indictor pops up whenever the spurious oscillation occurs. I measured it with a spectrum analyzer. There are spurious outputs present at 13.65 MHz and 2x and 3x that frequency when the problem happens. It looks like there is some RF leakage back into the synthesizer section which causes the synthesizer to produce these unwanted outputs. Funny thing - I found that the spurious tones dropped 40 dB or more when I lifted up the back edge of the cabinet cover about 1/2 inch so it appears that the "path" for the RF leakage or "feedback", if you want to call it that, is partially 'radiated' in nature rather than 'conducted' (two very common EMI terms). The added grounding they do for the "mod" seems to kill this mechanism most likely by essentially reducing the leakage path.

So what they should do for you is add the grounding that addresses the spurious oscillation problem and add the fan modification which involves adding a temperature sensitive switch to the fan control circuit. The "SWR" gemlin will be killed by the added grounding. You'll have a nice solid rig when you get it back.

Interesting theory. But I have 3 thoughts:

1 The diplexors usually only pass DC through the common<-->HF port
B The DC is only present during tune which is rare
trois The finals are probably capacitively coupled to the ooutside world
anyway

Thanks

It always pays to reseat every connector in the radio prior to sending the rig in. Quite often one comes loose making trouble inside. PS if the rx is degrading also add the fan mod to keep things cool. Mine suffered from RX degradation on HF and above and after the fan mod it was a happy camper.. If it continues.. Send it in for the "3 hour tour" to Cerritos.. Regards.. Richy N2ZD

I did clean up the mess! :-)

I just uploaded them to the Photos area of the Yahoo Group.

The bracket is a thrown-together design by me. I made it out of angle and bar aluminum bought from the local Lowe's hardware store. The radio is mounted using the Quick Release Mobile Mount, which is also compatible with the mobile mount for my FT-8100, so I can easily swap radios on this mount.

The angle-steel on the toolbox below the ATAS is leftover from a failed attempt to use a trunk-lip mount for the ATAS before I got the nice pre-drilled mount. I left it there so there wouldn't be any holes in my toolbox and to give me something to tie the coax to.

So, what sort of goodies can we expect to see in the tech supplement?

I had no complaints about the radio. I enjoyed it immensely and used it heavily. I'm looking forward to the day it returns. I have never seen a radio with a better noise blanker (Ford fuel pumps are horrible). It is so small and versatile. The FT-747 makes a sorry replacement (albeit temporary). I have friends with small HF mobiles and have used others. Nothing compares. The FT-100D is absolutely the best rig I have ever owned. If I had it to do again, even knowing about the problems, I would do it over.

> heavily. I'm looking forward to the day it returns. I have never seen a
> radio with a better noise blanker (Ford fuel pumps are horrible). It is

I'd like to once again clear up a confusion...

Ford fuel pumps are bad.

Ford spark plugs are horrible.

The FT-100 NB is a great tool against the horrible spark plugs, except in FM mode where it is not working at all. It does nothing against the fuel pump noise.

What's the difference? Fuel pump noise is a buzz that you hear momentarily as you trun the key from "off" to "run" WITHOUT starting ( we call that KOEOff ) which quits after a few seconds. Then of course it is on when the vehicle is running. They make an effective filter which my parts department parts@... will sell at a ham discount and when discounted it is about $50 and involves some installation. They say the tank should be dropped but I don't agree... I have had success putting it at the radio, although I am not sure it can take the current drawn by the radio.

Spark plug noise is a pop-pop-pop you hear only when the engine is running. About S-8. It is radiated out into the antenna. This is important- bonding a fiberglas hood will not work. Grounding your antenna will not cure this ill. I have found no solution to be effective.

I urge every ham to get an audience with their Ford/GM/whatever factory field engineer. Demand this be cured. Show him/her the noise extends well beyond 30MHz ( they have foolishly spec'ed the noise to "not" extend above 30MHz but we know it does ). If the factory gets a ton of complaints maybe something will happen.

# 13758. NH to WV Round trip Report *pictures*

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-27 15:02:30 UTC
From: am_fm_radio
Topic: 13758  Message: 13758

I've just returned from a trip from New Hampshire to West (almost heaven) Virginia Round Trip. I'd like to report on my mobiling with 3 HAM STICKS an FT100D new out of the box.

Let me give you the "line up":

The Hamsticks are mounted on a ball flanged under the tonneau cover of a 2002 GMC 2500HD Duramax pickup. I use an MFJ "tuner" a little $19.00 box that places a capicator at the base of the antenna for impedance matching. For those of you interested in prices, that's a $19.95 ham stick on a $30,000+ mount....(it's a joke, son)

The FT100D is mounted under the dash right above the gas petal. The microphone connector is connected to the rig, but the face plate was remotely moved to the overhead console.

The placement of the control head in the overhead console required the purchase of the remoting kit for the FT100D and quanity 2 6-32 by 3 inch screws. I also used a couple of #6 sheetmetal screws 1/2 inch long.

I'll upload pictures of my rig mounted, the over head console. and the hamstick mount.

Even though I had hamsticks on 80-40-20 meters, I only used 80 and 40, then I have a diamond antenna for VHF/UHF mounted top dead center of the cab.

I left late at night and checked into the 3905 Century club net. kicking on DSP I had no trouble hearing all fixed stations on the net. There were 3 mobiles in Hawaii... none of which I could hear at check in but I could hear them giving signal reports to others while I peaked a mountain in the Catskills. You may say I "Imagined" them, but I've worked HF mobile way too long. I received a number of 5x5 reports from stations 200-300 miles away. The day time use was split between VHF/UHF use and 40 meters. There on 40 meters I received 5x9 signal reports from stations as far away as 600 miles. The FT100D accepted the HAMSTICK SWR for about 30khz on 80 meters and 100khz on 40. My tests with the HAMSTICK-MFJ-910 allowed complete coverage of 20 meter phone band. The FT100D operated flawlessly. I own 2, I'm waiting (still) for the other to return from the factory mods. I'll post another message as to where the pictures are located . They should be under my call sign-W8LM in this group, under PICTURES

# 13759. Pictures posted!

From: am_fm_radio
Topic: 13348  Message: 13760

Michael....
as a 2 FT100D owner... you've gotten a number of good replys here. But tell me, have you made the same post at the IC706 group?

In fairness to the issue...ask the question on the IC706 group page...

Think of it as asking the NRA if you should buy a gun... obviously you should, but you see my point. I'd personally like to see the other point of view. Not to argue, but to see just how the "rest of the world" thinks.

# 13762. The FT-100 and PSK31

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-27 06:01:53 UTC
From: William Joseph Crossland
Topic: 13762  Message: 13762

Hi to the group,
Has anyone in the group had any experience using the FT-100 with the PSK31 mode? I am a bit interested in experimentation with this mode in the VHF, 2 metre, portion of the band. Apparently a group in Italy are having some success on that band.

What I would be looking for would be things like filter selection, suitable interface devices, connection to the FT-100 and any traps or tricks for the unwary. Thanks in anticipation.

Kind regards,
Bill Crossland, (VK2-TPW)

Hi MIKE;
Two years ago I took my FT100D and ATAS 100 out of the box, fixed in my Mercedes 300TD. and still are working 100%. No mods, no SWR, no oscilations, no BS.
According to my experience with the rig I wld't change it for any other.

# 13765. TCXO-8 Details

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-04-27 21:26:08 UTC
From: J. Craswell
Topic: 13765  Message: 13765

I'm only just getting going on the FT-100D but I wonder if someone else has already done this. For Civil Air Patrol use I would like to operate the FT-100D. It meets some of the HF NITA specs but fails Freq Stability even with the TCXO-8 option. I've looked at the different companies selling TCXO they have .5 PPM units and I'm planning to put together my own TCXO-8 PLUS that will be "ok" for CAP. Can anyone give me the details on who makes the current TCXO-8 and what the frequency is and what sort of output. TTL or?

Thank you!

73 de Jay Craswell W0VNE

Also is there a schematic / service manual in PDF (or other form) on the web?

I have used my ft100d mobile for the last month as i travel for my job. I have contacts in japan, europe, and south america using nothing but a 20 meter ham stick mag mount on top of the pick up truck. nothing else. It is a great mobile radio.

The TXCO-8 is three parts:
X2901 Xtal Osc 19.09333MHz (Manf # NTO-801BS)
and two bypass caps on the VCC (5V) side of the Xtal, 0.01uF and 10uF.
There is a schematic and layout in the tech suppliment I just got.

Jay, I most be missing something about the CAP frequency tolerance requirements. It looks like most of the req. in CAPR 100-1, Table 10-1 are 2-50 PPM except for SSB which is 10-20 Hz. The TCXO-8 is rated at +/- 1PPM from -10C deg to +50C deg. It would seem that is close and would work fine with a tighter temp range and a good tweeking. It seem a waste of time to gut the FT100 to improve on this??

Your reading the regs correctly. It needs to be .67 ppm for +-20hz over the NTIA red book temp range. I looked at the ARRL lab tests to verify that the FT-100D at 1ppm is too "loose" and it appears to shift +-40hz which the commo chiefs would find unacceptable.

Here is the link to the details. Note that the VHF compliance is also unacceptable. However ARRL lab tests show the portion it fails on looks more than adequate on the unit that was tested. *If I'm reading that right. I suspect Yaesu is giving a lower number so as not to be held accountable for some units that might miss the mark slightly. Too bad since the VHF approved list (to me anyhow) contains mostly equipment I would never think to purchase. The FT-100D is handy with it wide band receive. I like the fact that it covers Aero Band Civilian and Military aero! Not too many radios cover both (right now) It's a good unit but out of the factory no matter what mods you order your not supposed to use it for anything.

On checking the CAP page, they say it only does not meet their specs for VHF

HF listing
http://www.ntc.cap.gov/comm/equipment/HF_Lists.cfm

VHF listing
http://www.ntc.cap.gov/comm/equipment/Lists.cfm
"VHF Freq stability is without TCXO-8 High Stabilit"

So, it would seem that with the high stability TCXO-8 it would meet their specs.

Changing out the TCXO in order to meet the CAP frequency tolerance requirement is just the technical part of the exercise. You probably need to have the rig go through the Type Acceptance, Type Notification or whatever the current process is in order for it to be used legally in CAP operations. Those acceptance processes are generally done by the manufacturer rather than an end user. So my point is simply that you can't legally use it for CAP just because you've made some hardware changes that bring it within the technical requirements. It has to go through the whole documentation business with the FCC. I suggest you contact the FCC and get the straight scoop.

Dont go there, thats what got me "moderated" and post/time delayed .. :-) Richy N2ZD

The reference to the "3 hour tour" is that it takes an unusually long time to get a radio back from Yaesu when they proclaim that said radios have "no problems" and most problems are user related. Gee.. if that were the case, the radios should be back within 3 weeks.. If they really cared about their customers, they would supply the big dealers and repair facilities with parts and allow them to perform FT100 repairs to speed things up. Shame Shame as they say.. Regards

Gotcha - solid copy OM.

As far as Cerritos is concerned, I got lucky and just had a 17 day tour which wasn't bad at all considering the current multi-month turn around I've been hearing about. But that was April 2001, right before the word got out about the spurious oscillation problem. After that the fan mod and "SWR" mod really started hitting the bench.

Hi Dave I rechecked the HF section. Are you looking at the 1 Thousand D?
Not the 1 hundred D? The 100D does not meet specs with or without the
TCXO-8. It's close! Damn close but no cigar :(

********FT100 repairs to speed things up. Shame as they say.. Regards

In response to this statement, I have worked in "consumer electronics" repair shops for some 15 years now. The last 1 1/2 years as a repair tech at a Motorola dealer. Let me just say this, OVER two thirds of the radios brought in for repair, have NO PROBLEMS. I am sure Yaesu has the same policy that every place I have ever worked at does, first in, first looked at. Every time a Technician picks up the next radio in line, He first has to find the problem, on a ham Radio that is worse than on the "single banders" I work on most every day. Take the FT100 for example, 11 different bands to check, each with several modes etc., how much time do you suppose it takes to do that? well, the radio might check fine, now we better let it heat up awhile and make sure it is not an intermittent or heat related problem. Then check everything again. after all, only an IDIOT would send a radio in for repair before they checked the antenna, coax, coax connectors, grounds, power supplies, battery connections.. etc. etc. And the boss dont pay if the radio comes back a second time. The point is, It takes MORE time to double or triple check a radio that has no problem. Its much quicker to hook them up and find the problem right away, as when they really are bad. Now consider, for every radio that does have a problem, I have to look at two that dont. It is the "No Problems Found" radios that create the backlog at repair shops. I would think that Ham's would be more likely to rule every thing else out first, but experience has shown they are the worst. They refuse to believe their PL259 was not on right, because they did it themselves. For example, I went to a friends house to work a contest with 2 other Hams (Both educated Extras) when I showed up I found one of them on the Tower changing out the remote coax switch, The other one in the house inside the radio and amp because the receiver "lost sensitivity" before I got there they had changed the coax connectors, replaced jumpers..... They finally decided they RF overloaded the radio, when all was reassembled I sat down, looked at it for a few seconds, and showed them the squelch knob on the TS570. The receiver magically came back to life when the squelch was backed off!
If you say you haven't been involved in a situation like that before, you are a liar or have a bad memory. Just dont be so quick to blame the radio. I bought someone else's "Broken" FT100D and use it to this day with NO Problems, and NO repairs.

Sorry for being windy again!

I couldn't agree with you more, Jeff. But as my experience in managing computer repair facilities one other factor has to be tossed into the equation; budget and bottom line. The boss isn't going to give you more payroll if you're a little backed up and the techs have to turn some work around to make a profit. But no matter how you look at it one quarter of a year is too long to wait to have anything repaired. So perhaps they need to have better way of triaging the repairs. This might even include an interactive website where the user can follow a flow chart and eliminate the "Squelch Knob Syndrome" or other user error. As we would say, the problem is with the chair to keyboard interface.

Subject: [FT100] No Problems Found?.....

******** The reference to the "3 hour tour" is that it takes an unusually
********long time to get a radio back from Yaesu when they proclaim that said
********radios have "no problems" and most problems are user related. Gee..
********if that were the case, the radios should be back within 3 weeks.. If
********they really cared about their customers, they would supply the big
********dealers and repair facilities with parts and allow them to perform
********FT100 repairs to speed things up. Shame as they say.. Regards

In response to this statement, I have worked in "consumer electronics" repair shops for some 15 years now. The last 1 1/2 years as a repair tech at a Motorola dealer. Let me just say this, OVER two thirds of the radios brought in for repair, have NO PROBLEMS. I am sure Yaesu has the same policy that every place I have ever worked at does, first in, first looked at. Every time a Technician picks up the next radio in line, He first has to find the problem, on a ham Radio that is worse than on the "single banders" I work on most every day. Take the FT100 for example, 11 different bands to check, each with several modes etc., how much time do you suppose it takes to do that? well, the radio might check fine, now we better let it heat up awhile and make sure it is not an intermittent or heat related problem. Then check everything again. after all, only an IDIOT would send a radio in for repair before they checked the antenna, coax, coax connectors, grounds, power supplies, battery connections.. etc. etc. And the boss dont pay if the radio comes back a second time. The point is, It takes MORE time to double or triple check a radio that has no problem. Its much quicker to hook them up and find the problem right away, as when they really are bad. Now consider, for every radio that does have a problem, I have to look at two that dont. It is the "No Problems Found" radios that create the backlog at repair shops. I would think that Ham's would be more likely to rule every thing else out first, but experience has shown they are the worst. They refuse to believe their PL259 was not on right, because they did it themselves. For example, I went to a friends house to work a contest with 2 other Hams (Both educated Extras) when I showed up I found one of them on the Tower changing out the remote coax switch, The other one in the house inside the radio

and amp because the receiver "lost sensitivity" before I got there they had changed the coax connectors, replaced jumpers..... They finally decided they RF overloaded the radio, when all was reassembled I sat down, looked at it for a few seconds, and showed them the squelch knob on the TS570. The receiver magically came back to life when the squelch was backed off!
If you say you haven't been involved in a situation like that before, you are a liar or have a bad memory. Just dont be so quick to blame the radio. I bought someone else's "Broken" FT100D and use it to this day with NO Problems, and NO repairs.

Sorry for being windy again!

Just to say hello from Austria to all members connected to this fine forum...

I joined a few days ago, when I received my FT100D from the german dealer....
Took me 8!!! Weeks to wait for it...But I am happy to have a unit of the latest production series... The serial nr. Production date January 2002!!!
So I guess all the mods have been done??!! Anybody who can confirm this??

Anyway it□s a great little rig, and I really like it much even if I am only using it now for 2-3 days :-)))

BTW thanks for this forum, I have got some real good infos about the FT100... I had to decide between IC706MKIIG and FT100D... Finally I think I have done the right thing!!!

Greetings from Austria (NOT Australia, we have high mountains but NO kangaroos.... )

I HAVE BEEN GETTING HIGH SWR ON 440. IT WILL BE OK THEN ALL OF A SUDDEN THE SWR GOES WAY OUT. I HAVE TRIED THREE DIFFERENT ANTENNAS AND ALL THE SAME RESULTS. I ALSO NOTICED THAT THE RECEIVE ON 440 HAS CHANGED FOR THE WORST.

THIS IS PROBABLY A KNOWN PROBLEM. IT IS STILL UNDER WARRANTY UNTIL JULY BUT I WAS WONDERING IF IT IS AN EASY FIX. OR DOES IT HAVE TO GO.

Mobile or Base? If mobile, have you ruled out other things like the mount or the coax?

Having read this group since November, I wouldn't characterize it as a "known" problem.

In fact I have been involved in silly incidents that cause hours of down time and I have often emerged redfaced to find that it was a jumper etc.. But here we are talking about readily repeatable and Identifiable problems which occur in the majority ... Over and over again.

Overheating, the result? A blown final and rx degradation.. The cause? Firmware error not allowing fans to operate in relation to temperature (on UHF and VHF) rather they are timed to operate during tx plus 7-8 seconds..

Hi SWR.. Cause? Failing or failed copper tape "band-aid" solution inside the radio, some right out of the box, others like yours (foreshadowing element) will occur with age.

Once again, I reiterate.. If you dont complete these mods simply because your FT100 or D "works" now puts you in the minority and also puts your radio at risk.. It also opens you up to operating a sub-standard radio which at times may be in violation of FCC regs regarding spurious output.

As it has been established here, Yaesu will do the mods but will never admit to there being a problem. In addition, why should these "unnecessary" mods take 2-3 months to do? Everything else I have owned that has broken under warranty has been repaired in a "timely" fashion. You mentioned burn in band testing etc. True, but I have waited no more than a month for any radio I had repaired under warranty from any of the big three(including shipping time.) It simply seems that Yaesu didnt heed the warning and is no backlogged with radios at the owners expense.

I do agree with what you are saying, but not when it applies to Yaesu. These problems are the end result of Yaesu not taking action before shipping them. Things they were well aware of within the first year of production. In fact, the first post of failed finals and swr problems occured within the first few weeks/months of this lists

inception.

In addition, countless emails,phone calls etc. have been made to these people warning them of the problems. The end result? Nothing has been done to even attempt to correct these radios until approx May of 2001 where some of those vintage radios came with the swr mod.

Wanna fix it? Get to the end of the very long line of customers and wait your 3 months for repair. Thats Yaesu's way of saying Thank You to its customers.

Regards.. Richy N2ZD

Hi Keyton,

Mine was mounted in an Accord for some time. I did have some noise when the a/c or blower was on but it worked out ok otherwise. Mine was a 91 accord.. Firstly, get a separation kit and quick release bracket so you can mount the rig in the trunk of the car. I started by running some heavy gauge fused wire from the battery to the trunk area, then mounted the FT 100 to a aluminum square stock bar which was suspended from the trunk deck (there are three screw holes in the rear deck, pop the caps and hang the bar from those two forward most holes and make spacers so the bar suspends properly yet keeps the radio high enough to avoid damage. You can add a noise supressor next to the rig at this point also.
The rig should have two ground straps (Help automotive Brand valve cover ground straps work well and they are cheap) from each side of the rig to each bolt suspending the rig.

The ATAS is equally simple to mount.. Simply purchase the Lakewood brand license plate mount and make sure that you secure the mount to the car using bolts and nuts to prevent any chance of it pulling free from the car. They supply a ground strap which you can pass thru the license plate light housing to the inside of the trunk and ground it inside to the lid. You can invert the Lakewood supplied connector so that the connector mates with the atas and the threaded post faces down, mod the coax so it has weatherproofed lugs and attach it accordingly. Now you can thread the ATAS to the mount and remove it easily when not in use.

Mount the head unit in the vehicle with the Yaesu remote mount kit if you desire. I had mine attached to the glove box using the supplied bracket that came with the kit. Not the greatest place as its better to have the head mounted in your line of sight. So keep that in mind.. Regards.. Richy N2ZD

Hey we have also good beer in austria... even wheatbeer!! :-))))
No I don□t live near Arnolds home, he was born near GRAZ that□s in styria I am approx. 200km north-east from the city of GRAZ... My wife is studying medicine there....

Had no time today for the radio, the wheater was absolutely great with temperatures above 22 degrees...

BTW do you know if I have to modify my microphone, I have the standard model without the DTMF on it... (read something about mic mods few days ago on this forum here!!)

Should collect some more reports before I do anything to this cute little rig... :-)))

73´s from austria

K. I have a Chevy Cavelier but this applies to any mobile instalation.
You could use a Pana Vise swive mount to locate the control head in a more user friendly posotion. Also it would be reccomended to get the coil of the ATAS up high. I made a bracket that is mounted underneath to the frame of my car. And by all means do run heavy guage cable directly from the battery and fuse it close to the battery. If you don't fuse it close to the battery and there is a short between the rig's fuses and the battery then you will start a fire. Make all leads a short as possible. As for blower noise and such, try putting a few split ferrite bead over those leads. Good luck and happy mobiling.
Check out the installation here:
http://mywebpages.comcast.net/w3iz/mobile.html

# 13801. RE: [FT100] Honda Accord, FT-100D, and ATAS-100

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-05-01 18:10:16 UTC
From: Nelson Moyer
Topic: 13789  Message: 13801

My setup uses the trunk mount and remote mounting kit. I used the Diamond K400 mount and placed it as close to the trunk hinge as possible for structural support. Honda uses pretty flimsy steel and the mount tends to flex a bit at highway speed. I used coax braid to ground the radio mount to the frame. I ran the cables under the inside trim molding on the driver side around under the dash to the console. I made an aluminum mounting plate to support the remote head bracket, painted it black, and attached it to the two screws under the dash even with the console. I punched a hole in the rubber grommet in the firewall on the driver side to get the power cable into the car. I'm using a remote speaker clipped to the driver side visor. I had to put a piece of velcro tape on the back of the speaker to keep it from sliding off the visor. The speaker wire is hidden behind the trim molding on the left side of the windshield. No wires show, and the only holes I made were in the firewall grommet and the frame in the trunk for the coax ground wire to the radio mount in the trunk. The remote wires will pass thought to the trunk by pulling back the edge of the back seat a bit. There is already an opening there, and I used a straightened coathanger to fish the wires. I check the continuity occassionally between the antenna mound and chassis ground every couple of months so the ATAS-100 continues to tunes OK. I've never had a problem with this setup. I do mostly HF mobile on trips, and 2 meters locally.

# 13802. Re: No Problems Found?.....

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-05-01 18:11:46 UTC
From: backhoefade
Topic: 13787  Message: 13802

One of the key points is that the FT-100D has two basic design flaws, one of which is present in every unit (no fan operation during extended VHF/UHF receive periods), the other of which is present in a fairly sizable percentage of rigs (spurious oscillation at 13.65 MHz and 2x and 3x that freq which causes the SWR icon to show). The complaint of many is that Yaesu decided to handle these issues on an individual customer complaint basis rather than addressing the whole thing with an overall recall or at least a published warning which advises about the manifestation of the problems and how to fix them. Instead, we had to discover this through discussion on the Yahoo discussion forum. The numerous attempts to solve the spurious issue by installing additional external grounding, etc, while the correct solution (known by Yaesu) was to install internal ground straps screwed into the chassis rib, was a source of huge frustration for many FT-100D owners. This has led to certain degree of mistrust on the part of many Yaesu clients so they were probably re-thinking their approach to handling the two known design flaws at some point. But they continued to handle the two know design flaws on an individual basis. That's what a lot of people are upset about (at least the ones that are aware of the real situation). Lesson learned? That's an easy question - in the future when you consider buying a rig, check out the level of criticism on the web forums. There is no more honest and straight forward critique than that of the paying customer. And always bear in mind that the QST (and other magazine) product reviews are going to emphasize the strong points and gloss over the weak points in any product they review since they don't want to bite the advertiser's hand that feeds them.
Last comment - the FT-100D is one excellent rig (once you fix the oscillation and fan issues). The receiver is outstanding!

>
>
> In response to this statement, I have worked in "consumer electronics" repair shops for some 15 years now. The last 1 1/2 years as a repair tech at a Motorola dealer. Let me just say this, OVER two thirds of the radios brought in for repair, have NO PROBLEMS. I am sure Yaesu has the same policy that every place I have ever worked at does, first in, first looked at. Every time a Technician picks up the next radio in line, He first has to find the problem, on a ham Radio that is worse than on the "single banders" I work on most every day. Take the FT100 for example, 11 different bands to check, each with several modes etc., how much time do you suppose it takes to do that? well, the radio might check fine, now we better let it heat up awhile and make sure it is not an intermittent or heat related problem. Then check everything again. after all, only an IDIOT would send a radio in for repair before they checked the antenna, coax, coax connectors, grounds, power supplies, battery connections.. etc. etc. And the boss dont pay if the radio comes back a second time. The point is, It takes MORE time to double or triple check a radio that has no problem. Its much quicker to hook them up and find the problem right away, as when they really are bad. Now consider, for every radio that does have a problem, I have to look at two that dont. It is the "No Problems Found" radios that create the backlog at repair shops. I would think that Ham's would be more likely to rule every thing else out first, but experience has shown they are the worst. They refuse to believe their PL259 was not on right, because they did it themselves. For example, I went to a friends house to work a contest with 2 other Hams (Both educated Extras) when I showed up I found one of them on the Tower changing out the remote coax switch, The other one in the house inside the radio and amp because the receiver "lost sensitivity" before I got there they had changed the coax connectors, replaced jumpers..... They finally decided they RF overloaded the radio, when all was reassembled I sat down, looked at it for a few seconds, and showed them the squelch knob on the TS570. The receiver magically came back to life when the squelch was backed off!
> If you say you haven't been involved in a situation like that before, you are a liar or have a bad memory. Just dont be so quick to blame the radio. I bought someone else's "Broken" FT100D and use it to this day with NO Problems, and NO repairs.

You have the fairly common problem of spurious oscillation which is corrected by adding some internal grounding straps which get screwed into the chassis rib. You will likely see similar behavior when you try operating on 24 and 28 MHz. I suggest you have the Yaesu service center do the mod if it's still under warranty but be prepared to give up the rig for quite a few weeks. You should ask for the "VHF/UHF fan mod" while you're at it. That will allow the fan to come on automatically during long receive periods of VHF/UHF operation.

Topic: 13791  Message: 13805

Welcome to the forum, Chris. Nice to have you aboard. Your manufacture date is the newest I've seen on here. The serial number must start with 2C. Right?

I don't know whether anyone can really say for sure if the mods have been done on your new 100D. Do the fans run continually on VHF/UHF like they do on HF (when receiving)? If they do, then at least the fan mod has been done on yours. Also, mention has been made of a Blue dot on the label or box. Do you see anything like that?

Let us know.

73,

Dick

Subject: [FT100] NEW TO THE FORUM

Just to say hello from Austria to all members connected to this fine forum...

I joined a few days ago, when I received my FT100D from the german dealer....
Took me 8!!! Weeks to wait for it...But I am happy to have a unit of the latest production series... The serial nr. Production date January 2002!!!
So I guess all the mods have been done??!! Anybody who can confirm this??

Anyway it's a great little rig, and I really like it much even if I am only using it now for 2-3 days :-)))

BTW thanks for this forum, I have got some real good infos about the FT100... I had to decide between IC706MKIIG and FT100D... Finally I think I have done the right thing!!!

Greetings from Austria (NOT Australia, we have high mountains but NO kangaroos.... )

Chris

Regarding the Ground Strap and Fan mod for the High SWR on 440.

Is there any visible way to check and see if these mods have been done other than opening the radio?

Thanks
I really appreciate the feedback... I will hate sending the radio back to yaesu.

Sold my truck and no where to put my radio for now.
Guess I will sell it and get another one in a few years.
Have the radio and antenna for about 2 and half years --Love it!
Never had a problem. Did do the fan mod just in case.
Has separation kit, boxes and manuals. Early model, not a "D".
Non-smoker, no major scratches or damage to the unit. Looks almost new!
Everything Works! Will through in antenna mount to boot!
Asking $800 for all!

# 13808. ATAS-100 ??

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-05-01 20:58:12 UTC
From: Marshall, Keith
Topic: 13808  Message: 13808

First time writing to the FT-100 group. Seems to be a lot of good information floating around from the subscribers to the net. I have had an FT-100 for about two years now and it has worked great with no problems until recently. It is in it's second Honda Civic. The first one was a 1998 and now a 2001 LX. The radio is mounted under the passenger seat and the control head is remote mounted to just below the commercial radio. I did use an Outbacker Perth on the license plate mount with the FC-20 tuner. A year ago I changed to the ATAS-100 also on the license plate mount.
All worked well until a friend acquired a used ATAS-100 that would not tune correctly. We swapped it with mine to see if it was an antenna problem. The problem turned out to be grounding. But while un-screwing my ATAS-100 the stainless steel adapter that the SO-239 screws into, at the base of the ATAS-100, was also turning. When I noticed this I re-tightened the SS base but the antenna ceased to work after that. This was prior to my knowledge of this group. Being the Antenna was dead and no continuity between center conductor and ground I proceed to disassemble. Being that the base had already been un-screwed, I removed it. There is a plastic sheath above it held on with two small set screws. I removed the sheath. There I found the cause of the problem. Under the sheath is a plastic, (Teflon?), coil form with wire about a # 14 gage wire wound on it. It had become detached from the top where it had been soldered to the outer conductor of the antenna. The problem was that the end of the wire was about 3/8 of an inch past where it had previously been soldered. Not knowing how the coil form was held in place I soldered the wire where it was. After reassembly the antenna would tune again but only some bands. I plan to have another go at it but before I do thought I would run it past the group to see if anyone had any experience or suggestions.
OBTW I did look at the K0LEE website at the ATAST4.jpg drawing. The area I am referring to is labeled Remote Unit on the drawing, but no parts break down.

Mostly yes; but it's been reported on 440 MHz also. Some people have reported VHF/UHF PA 'death' for no good reason, so take a gander.

# 13813. Re: ground strap and fan mod.

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-05-02 04:21:26 UTC
From: backhoefade
Topic: 13806  Message: 13813

My understanding is that the same ground strap that fixes the HF stability issue also addresses the 440 MHz one. You can see photos of the proper "screwed into the chassis rib" modification here in the photos section. The only way to check if it has been done is to open up the rig. That's not that big a deal to do - just do it carefully. You have to remove the screws that hold the chassis covers in place. The top cover removal will expose the area where the 'screwed in' ground strap should be. You will learn that chassis covers have tabs that slip in under the front piece of the rig so you will have to carefully lift up the rear portion of the chassis cover and pull it out towards the rear of the rig to free up those tabs from the front portion.

Actually it might be two screwed in ground straps - check the pictures or someone else can comment on whether or not it's two straps. Regardless of the number being one or two, it (or they) are screwed into the chassis rib.

The Yaesu fan mod consists of adding a temperature sensitive switch on top of the VHF/UHF PA. I believe they actually glue the thing onto one of the PA devices. There are pictures of that addition in the photos gallery of this website and elsewhere. You have to take off the bottom chassis cover to view whether or not that mod was done since the PA devices (both HF and VHF/UHF) are mounted on one of the the 'underside' circuit boards.

Hi everybody:

I am new to the group. My name is Omar YK1AO. Best regards to all those of you that I ever worked and to those that do not know me hoping that we can have a qso one day.

Saad, N5FF who is visiting Damascus now told me that he heard that there are two major modifications that should be made to the FT-100D. Something about the SWR and the other about the fan.

I have a FT-100D donated graciously by the YK9A group. It was bought in February 2001. I operated it only a couple of times. But now that I know of the modifications, I would like to do them and start operating this nice radio.

I need help, please with detailed instructions of what should be done.

Van anybody help, please ? Thank you.

Best 73 to all

Omar, YK1AO

I've been using a homemade project (The Robot Shack) that interfaces to CAT type radios. I just picked up an FT100 to insure it works with it. The project is a small card that plugs into the Printer and Com port of a PC. The program is pretty small (Written 100% in assembler) and responds instantly to commands. You need to connect it to two radios (Above 2 meters) I use 440 and 1296 myself. In short you dial up the base it lets you change modes, dial up and down or enter frequencies. It is not smart enough to stop at band edges if you dial up or down too long (Yet) so you have to be carefull. The current system sends it's feedback in CW but I'm working on replacing those messages with a sexy female voice <grin> I'm also working on a robust authentication scheme so "weirdos" don't take control of the system. It has a 3 minute time out (Without activity) to keep it Kosher with the FCC rules. Right now we have two of them that we are playing around with. The hardware is a nice double sided PCB with through holes, silkscreen etc. You can stuff some or all of it based on what you want to do. I have a couple of crude relays to do remote control type functions. *I wanted to be able to move the rotor while on the roof remotely. You can even open the garage door or feed the pets if you like! If your interested email and I'll gather up some JPGs to send you. It's pretty cool for a D.I.Y. (Do it yourself) project.

Good luck, and let us know how you make out. The first one I did didn't have screws at the top of the matching section a.k.a. the bottom three inches of the ATAS (it was pinned at both ends) which makes it nearly impossible to take apart with hand tools --- the pins are much harder metal than the surrounding base, very difficult to drill out. With the older ATAS's, you're better off replacing the bottom three inches (at $160) than trying to take it apart. If I had to do it again, I would use the pins as alignment marks (it appears in most pictures that the pins and the solder tabs all fall in one line), drill two 1/2 inch holes through the tube where the solder tabs should be, resolder, and then cover the tube with some large diameter heat shrink.

You have a newer version ATAS which has a screw to replace the top pin (gee, I wonder why they did that...). I'll be interested to see how much easier it makes the process.

If you have a digital camera, document and post in the files portion. You and I aren't the only ones who have been down this road.

Bill

Jan,

Thanks for the information on your project. Yes, I am
very interested and would like to learn more. I bet
there are others in this group as well. Perhaps you
could use the Files area to post some photos?

Omar, welcome to the group. You'll find a lot of help here, so don't hesitate to ask, even if there is someone counting the number of questions you ask. That's why we're all here.

You will find just about everything you need on the FT-100 Yahoo Groups web site, including pictures, modifications, etc.

73,

Dick

Subject: [FT100] New

Hi everybody:

I am new to the group. My name is Omar YK1AO. Best regards to all those of you that I ever worked and to those that do not know me hoping that we can have a qso one day.

Saad, N5FF who is visiting Damascus now told me that he heard that there are two major modifications that should be made to the FT-100D. Something about the SWR and the other about the fan.

I have a FT-100D donated graciously by the YK9A group. It was bought in February 2001. I operated it only a couple of times. But now that I know of the modifications, I would like to do them and start operating this nice radio.

I need help, please with detailed instructions of what should be done.

Van anybody help, please ? Thank you.

Best 73 to all

Omar, YK1AO

From: Jim Lasswell
Topic: 11373  Message: 13821

Hi folks... I have done all the mods to my FT 100 and this little rascal works like a charm. Now I have a AM filter coming from AES , and was wandering if any one on this list has done it and how they did it.I have been told that I sound like @#$@$@#$ on AM, so I think I better install on. Any help would realy be apriciated. Thanks much. AD6DW Jim

I have posted a brief guideline for AM operation with the FT-100D at
http://www.mods.dk

I also discussed it in several postings here but I'd have to search
for them.

In addition to the basic setup described at the mods.dk site, you can
get a bit more linear operation and see some nice "upward modulation"
by setting F15 to about 165. But when you finish AM operation crank
F15 back down to the original factory setting that gives you an even
100 Watts output CW.

One more suggestion - do the stock mic modification originally
described by N2ZD, Richy. That's described in posts here and I also
posted it (with credit to Richy) at the mods.dk site. Once you get
that plastic baffle out of there and open up the 3rd hole people
won't even believe you're running an FT-100D. That goes both for SSB
and AM op.

Hey - look at the bright side - at least they let you in !

Installing it is a tedious and potentially disasterous operation because it's tight quarters and there are a bunch of ribbon cables and other wires that have to be moved carefully out of the way. I know that when I installed my 6 kHz filter I had to temporarity cut one wire that looked like a 're-work' effort by Yaesu. Then I had to re-solder it and insulate it. But the real fright came when I finished up. My receiver was acting very strangely; sounded very distorted and many functions were dead. Turned out one of the several ribbon cables that press into PC mounted connectors was partially unseated; so pay close attention to those ribbon cables. You have to tilt one of the PC boards over in order to solder in the filter. The Instruction Manual shows you where to mount the filter. You're on your own as far as the basic task as I couldn't possibly recall all the little steps involved. It's really just common sense for the most part. Once you get it soldered in and the unit packaged back up you have to go to one of the menu functions and select the 6 kHz filter option. You'll know you have the menu set up correctly when the 6 kHz filter selection button starts responding.

So my best advise is to look in the Manual near the back and check out the drawing they have indicating the filter positions. Then just proceed slowly and carefully and you will get there. I have received outstanding AM transmit audio reports with the FT-100D, especially after the mic mod was done.

I bought my FT-100 on Dayton w/e at HRO when the '100D was introduced and saved a lot of $$$. If you don't need the latest and greatest for a rig that you use part time (mobile) then you can get a good deal.

# 13831. Fan and SWR Mods

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-05-02 23:47:15 UTC
From: w6mdk
Topic: 13831  Message: 13831

Dear All,

Although I have been following this group since I got my FT100D several months ago, I don't think I've posted any messages prior to this one. I'd like to start out by saying that I think you are all a bunch of courteous, helpful people, and I very much appreciate what I consider to be the proper use of the internet. I am happy and honored to be part of this group.

That said, the reason I am making htis post is to tell you all that I decided to do the fan mod today, in spite of the facts that 1) I don't do a whole lot of VHFing and 2) the rig is still very much in warranty. I wanted to figure out a way to do the mod so that I could remove it with no adverse, potentially warranty-busting effects. I believe I have accomplished that.

What I did was to insert one lead of a 47 ohm resistor EXTREMELY snuggly into the black wire connector on one of the fans. I DO mean snuggly. Then I cut the other lead as short as possible, made a small loop, and carefully placed the loop over the screw hole in the center rib of the rig. I put a small piece of black tape over the resistor to keep it in place and to prevent any potential shorting. When I put the bottom cover back on, I was careful to insure that the loop was directly under the hole, so the screw would hold it securely in place. I appear to have succeeded. It is working beautifully, and I can remove it any time I wish without leaving any solder behind. When the warranty period is over, I'll solder it in place, but for now it is doing exactly what I wanted.

Also, for information, the SWR mod was apparently done at the factory, as the copper strip is held in place by a small sheet metal screw. My serial number starts with 1I, so that tells you that, at least when this one was made (July 2001, if I am correct), they were doing the mod before it left the factory.

Again, thanks to all of you for the help this site provides. I'll be posting more tidbits if and when I feel I have something of value to add.

Topic: 13831  Message: 13832

Thanks for the information, Mike. I have printed out your message and will do the same thing. My FT-100D is still under warranty. My serial number starts with 1L, so, maybe mine has the SWR mod also. I hope so anyway. I know it doesn't have the fan mod, as the fans only come on while I am transmitting on V/U and stay on for just a short while after transmissions stop.

Subject: [FT100] Fan and SWR Mods

Dear All,

Although I have been following this group since I got my FT100D several months ago, I don't think I've posted any messages prior to this one. I'd like to start out by saying that I think you are all a bunch of courteous, helpful people, and I very much appreciate what I consider to be the proper use of the internet. I am happy and honored to be part of this group.

That said, the reason I am making htis post is to tell you all that I decided to do the fan mod today, in spite of the facts that 1) I don't do a whole lot of VHFing and 2) the rig is still very much in warranty. I wanted to figure out a way to do the mod so that I could remove it with no adverse, potentially warranty-busting effects. I believe I have accomplished that.

What I did was to insert one lead of a 47 ohm resistor EXTREMELY snuggly into the black wire connector on one of the fans. I DO mean snuggly. Then I cut the other lead as short as possible, made a small loop, and carefully placed the loop over the screw hole in the center rib of the rig. I put a small piece of black tape over the resistor to keep it in place and to prevent any potential shorting. When I put the bottom cover back on, I was careful to insure that the loop was directly under the hole, so the screw would hold it securely in place. I appear to have succeeded. It is working beautifully, and I can remove it any time I wish without leaving any solder behind. When the warranty period is over, I'll solder it in place, but for now it is doing exactly what I wanted.

Also, for information, the SWR mod was apparently done at the factory, as the copper strip is held in place by a small sheet metal

screw. My serial number starts with 1I, so that tells you that, at least when this one was made (July 2001, if I am correct), they were doing the mod before it left the factory.

Again, thanks to all of you for the help this site provides. I'll be posting more tidbits if and when I feel I have something of value to add.

73,

Mike

I've cheated a little in my repair project and called the tech support guys for some phone support help. Wow! I want to say to all my fellow FT100 Egroups friends that Mike & Jerry at Yaesu took my symptoms (Which frankly puzzled me) and came up with the suggestions that found the problem with my new "baby." I've still got to fix the -9 Volt supply problem but I wanted to say what a great job these guys do for us Amateur Repair folks! Thumbs up to Yaesu and fooie on the guys who say you can't fix your own stuff. You can with a little help from your friends! <grin>

The FT-100D is being replaced by the FT-100-7R. This is the upgraded
model that is submersible for 30 minutes at 3 feet.

On a more accurate note, my FT-100D will be back from Yaesu on Monday,
May 6. The radio was received at Yaesu on March 8, checked in on March
11, shipped back via UPS 3-day Select on May 1.

# 13840. Re: [FT100] Fan and SWR Mods

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-05-03 03:26:59 UTC
From: Dick Thompson
Topic: 13831  Message: 13840

Well, Mike, I did the fan mod this evening and it seems to be working just fine. Like you, I didn't solder anything in case I ever had to send the rig into Yaesu for a repair.

I don't know if the SWR mod has been done on mine or not. I see references to the grounding strap being screwed into the separation ridge in the chasis, but mine sure isn't screwed in.

So far the fan is running and when I key the mike the fan speed increases. I did the grounding at the center hole screw on the bottom and made a small loop. After the warranty is up, I will solder the resistor to the black wire of one of the fans and to a ground on the chasis. But it seems to be working OK. My one concern is if it will come out of the black lead connector while mobiling and bouncing around. I'll keep an eye on it.

Thanks.

Dick,

Just make sure that there is some kind of pressure on the resistor to keep it from bouncing around. There are numerous ways to do this. Or you can do what I did, which is to secure it in place with a piece od black tape.

Does this radio have a better receiver than the Icom 706?

Would a new radio still have to be sent back to the factory to have the mods done?

I have read about the fans having to run all the time during receive,is this very noticeable?

I want to use the radio for mostly listening and receiver quality is my main concern.

I thank you can guess I am trying to decide between the FT 100D and Icom 706 as to which has the best receiver.
Thanks for any help.
Larry

For us old-fart amateurs (I mean licensed around forty years or more) the universal solution is plenty of black tape, hi.Can't hurt anyrthing, it is STILL cheap (a buck a roll at HRO) and you can take it off with no residue.

Now, for securing things to exterior or cosmetic surfaces when you want to be able to remove them them with absolutely NO trace (as in mounting things to the dashboard of leased cars) the only real answer is silicone sealant, the kind that GE makes that you use in your bathroom. Use the clear stuff. It will stick anything to anything and will peal away as if it was never there when you want to remove the object. It doesn't even leave a mark or a residue on the leather or vinyl. That;s how I mounted the separation kit face-plate bracket to the dashboard of my explorer. If anyone is interested in photos, let me know and I'll upload them.

To me, it is slightly noticeable only when I am using it as a base station in an extremely quiet room. In the car, or if the space has any amount of ambient noise, you can't hear it.

While I can't offer a comparison with the 706, I can tell you that the salesman at HRO who sold it to me (who is a friend also) owns the 706 but steared me to the 100D. In addition, the 100D gives you the option of using the ATAS-100 which, for my money, is reason enough to pick the 100D over the 706 with no other considerations.

I must admit, too, that I like the blue display a lot more than the green one, but that is just aesthetics.

Lucky you to have the SWR mod already done. And now that you've done the fan mod you have the two major bugs squashed.

There's one more thing you can do that makes a big difference in performance. If you want to eliminate the somewhat muffled transmit audio in the rig (that most hams politely, though not helpfully, don't bother mentioning when you're working them) you can do the mic mod that was originally described my Richy, N2ZD. It posted here and also at http://www.mods.dk
It really makes a heck of a difference but you have to be careful doing the mod. There's also a note at the mods.dk site regarding AM operation with the FT-100D, something that the Manual completely lacks in information.
Good luck and enjoy the rig!

# 13849. Re: Ft 100D Receiver

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-05-03 17:08:05 UTC
From: backhoefade
Topic: 13844  Message: 13849

This is the easiest question I'll ever answer on this board.
The primary reason I bought the FT-100D was because the receiver is clearly superior in several respects:

1) Higher front end intercept point. In other words it won't overload in the killer spectral environment of your typical field day scenario.
2) Superior adjacent channel rejection performance: no need to explain the value of that!
3) Variable bandpass DSP which lets you dial down to 60 Hz BW on CW and also lets you custom tweak your low frequency and high frequency cut-off frequencies during SSB receive. It's great during crowded band conditions and for times on 40 meters when the adjacent broadcast stations are there.
4) Superior noise blanker - it works very well.
5) Ability to tune above 460 MHz so you can listen to public services around 488 MHz, etc.

The only 'bugs' in the FT-100D are the spurious oscillation issue and the fan issue on VHF/UHF both of which have well known remedies. Once you take care of those you're home free. I recommend the "N2ZD mic mod" as the last improvement. It really cleans up the somewhat 'muffled' transmit audio that a lot of people report with the stock mic.

If you appreciate an excellent receiver you will love the FT-100D! My only on-going complaint is the fan noise (but I can always throw on the headphones if needed and if you do a lot of listening the fans won't come on all the time and will likely never jump to their fastest (noisiest) setting).

The fan noise might be a problem then as I was also going to use the rig as base.
Thanks for the replies.
Larry

My experimenting suggested I use about a 180 Ohm value. The fans are spinning, though not fast, but enough to keep things much cooler than stock, and very quiet at that rpm.

I use the radio as base station only and the little fan noise doesn't bother at all !
Peter PE1ECM

I have read about the fans having to run all the time during
receive,is this very noticeable?

What do you think of this email from AES as to the mods?

"There won't be any mods since they are the latest versions. Both
models perform
similarly. I don't think you can go wrong with either model. We
have sales
people that own both models and are very happy with them. Even our
sales of
these items are about even with Icom have a couple radio edge".

Is this person misinformed or misleading?
I like the specs on the radio but am still concerned about the noise
using as base,because I mostly listen.
Thanks again.

Hi Larry
That Fan noise is so slight you hardly hear it, because it runs at such a slow RPM. I have mine in the shack with my computer and the computer makes far more noise than the FT 100 does. I don't even hear it when it is at an idle. It can idle all day , and is still cool man, cool !! Jim AD6DW

Honestly - because you said you "mostly listen" I will tell you right now that the fan noise will be a non-issue with your base operation. You will like the receiver for all the reasons I just mentioned in the post a few back. Don't worry about the fans. The only time they run fast during receive is when you have been transmitting full power for a long time. Even then they generally kick down to their low rpm setting in short time. Plus, if you're mainly just receiving they generally won't come on at all. I would hate to see a fellow ham pass up the superior FT-100D receiver due to concern about fan noise, especially since you emphasized that you are very interested in getting an excellent receiver. Did you read my post where I spelled out the advantages of the FT-100D receiver? All true.

You won't even notice them with the blower running on your amp.
Seriously, your car's air conditioner blower is louder than the fans in the FT-100.

Date: 2002-05-03 19:16:10 UTC
From: Dave Adams
Topic: 13831  Message: 13865

My FT-100D is installed in my 2000 Toyota Tundra pickup, remote mounted under the passenger seat w/ the control head above the rearview mirror. ATAS-100 mounted on the pickup bed stake hole. Power leads are run straight to the battery terminals.

I get a moderate amount of what sounds like ignition (spark) noise on HF AM or SSB. FM is fine.

What's the best way to get rid of the noise ???

# 13866. Re: [FT100] Ignition noise suppression

Hi Dave.
You won't hear ignition noise on FM because it is a amplitude modulated type noise (AM). Have you tried a filter capacitor from hot lead to ground? If necessary you can shield your leads with some braid taken from some RG-8 coax. Also, a short ground wire from the chassis of the rig to ground will help. I used a piece of braid about 6" long.

Complain to Toyota Motors America through your dealer.

Be sure to show the factory rep how bad it is above 30MHz since they seem to
thing the noise is natural below

Boy, Mike, you have been around a while. I can tell by all the high tech methods you mention to attach things to other things. ROFL!!!!! All you need now is a roll of duct tape and something to attach. :)

I went back into my FT-100D a while ago and laid a piece of that high tech black tape across the resistor to help hold it in place. Works like a charm.

Let's hear it for "high Tech"!!!!

Subject: Re: [FT100] Fan and SWR Mods

For us old-fart amateurs (I mean licensed around forty years or more) the universal solution is plenty of black tape, hi.Can't hurt anyrthing, it is STILL cheap (a buck a roll at HRO) and you can take it off with no residue.

Now, for securing things to exterior or cosmetic surfaces when you want to be able to remove them them with absolutely NO trace (as in mounting things to the dashboard of leased cars) the only real answer is silicone sealant, the kind that GE makes that you use in your bathroom. Use the clear stuff. It will stick anything to anything and will peal away as if it was never there when you want to remove the object. It doesn't even leave a mark or a residue on the leather or vinyl. That;s how I mounted the separation kit face-plate bracket to the dashboard of my explorer. If anyone is interested in photos, let me know and I'll upload them.

I'd be suspicious they wanted to sell more FT-100D's and aren't admitting anything. Either that or the person you asked is leading a "sheltered" life. Despite the mods, it's still a good rig.

A friend of mine had to send his into the shop for repair. I think it was sent to Burghart's where he bought it about 3 years ago. The VHF/UHF final Amp is gone on it. Price quoted to fix it is $350. Has anyone on this reflector had a similar problem and if so, would you care to comment on what it cost to replace the VHF/UHF Final Amp?

Also, unless I'm mistaken, I recall some comments about buying some from a wholesaler as a group order to keep the price down. What would the price be if that would happen? Anyone know?

# 13870. Re: [FT100] Ft 100D Receiver

Yahoo group: FT100 (2002-01 — 2002-06)
Date: 2002-05-03 20:31:12 UTC
From: Dick Thompson
Topic: 13844  Message: 13870

You're letting comments on the reflector cloud your judgement, Larry. There are known modifications that can be made to the FT-100D. The fan mod is a simple thing. I did it on mine last night. It took me more time to put the screws back in the cabinet than it took to do the mod to the fan. The fans on the FT-100D while in HF mode, run all the time. Faster when transmitting and slower when receiving. When you are in VHF/UHF, they only run when you transmit and for a short time after you stop transmitting. If the radio you get has fans that purr while receiving on V/U freq's, then you have the mod. If not, you can do it yourself. As for the High SWR Mod, that's something that opinions differ on. But in my opinion, to buy the radio and immediately send it in for modifications doesn't make much sense. Buy it, use it, then decide. Since I made the fan mod last night, my rig is running cooler than before. But, it never was so hot (as some claim) that I couldn't touch it. I've been hamming for 40 years. There is no perfect radio. If you think there is, you lead a sheltered life. Many thousands of FT-100D's have been sold, as well as FT-100's. If some of them get sent back for mods, it's not a big deal. I think in time that Yaesu will just do the mods when they manufacture the radio. I'm not sure, LArry, but they may already be doing that.

Are you licensed? If so, what is your call sign? If not, are you studying for a license? If not, why do you want a transceiver as a receiver when there are cheaper options, unless you are planning on converting it to the CB frequencies or operating it illegally in the ham bands? No accusation there, just questions. Most of us use our call signs in our e-mail or signature. I just haven't seen one for you and am curious.

73,

Dick
WB0DUL@...

I have had a chance to try the 706 & the 100D. The receiver in the 100D is much better. The ATAS is a nice antenna, but proper grounding is the key to operation. In other words, ground the hell out of it.

Subject: [FT100] Ft 100D Receiver

Does this radio have a better receiver than the Icom 706?

Would a new radio still have to be sent back to the factory to have
the mods done?

I have read about the fans having to run all the time during
receive,is this very noticeable?

I want to use the radio for mostly listening and receiver quality is
my main concern.

I thank you can guess I am trying to decide between the FT 100D and
Icom 706 as to which has the best receiver.
Thanks for any help.

The fan noise might be a problem then as I was also going to use the
rig as base.
Thanks for the replies.

Dick,

Duct tape is too damned mdern for me. Seriously though, silicone glue did not exist when I was a kid. I had a Gonset Cmmunicator II bolted to the transmission hump of my 1961 Falcon, powered by a power inverter. Eventually I replaced it with a Heathkit Twoer that I built when I was about 17...Worked great, but they were so heavy, I HAD to use bolts. Besides, no-one leased cars back in those days!!

As you like to use the radio a lot for its receive capabilities, then you need the one with the best performance and frequency coverage....the FT100. If the low level of fan noise is still a problem, then buy the separation kit and mount the radio in a cupboard or similar (ensure good ventilation). Its hard to imagine the fan noise being loud enough to be a problem if mine is anything to go by.

Grant, ZL2BK.

Hey Dave.....I installed a FT-100D in a Toyota 4Runner. My only other mobile installation was in a ford explorer. Very little RFI in the explorer, but the vehicle was always having a problem and was dumped. The FT-100 has been a great radio; even through the "mods" and all. The Toyota is a great vehicle, but very noisy. Unfortunately, I need a reliable vehicle. Never seems to be a good balance. Quite a bit of conducted as well as radiated RFI. I had success in solving my problems due to the following.... There are articles in QST (Manufactures Rec's) & QEX (Auto RFI Elimination 1-2000) about solving this problem, as it specifically relates to Toyotas. If you don't have access to these sites, contact me directly for info......

I found that if I connect a dummy load to the HF connector, the noise goes away completely. So I'm reckoning that the noise is all radiated noise picked up by the antenna and not induced in the power wiring.

I did a search on the ARRL website and found a link to the QEX article, but unfortunately the link is misdirected and brings up an article about PSK 31.

A spurious oscillation when operating on 440 has been documented in some units. In my case, it went away after I did the mod for the HF spurious. Be careful if you are experiencing this--it can lead to destruction of the VHF/UHF final.

> onto one of the PA devices...

'Just a comment on the "temperature sensitive switch" placed by the service department on the VHF amp. When mine came back with the fan mod, the switch wasn't glued in place but was held over the VHF amp by one of its leads being soldered to a rigid point of attachment. However, the "springiness" of the soldered lead caused the switch to actually "hover" a fraction of an inch over the amp's surface without contacting it. I experimented until I found a rubber foot with exactly the right thickness to place between the sensor and clam-shell cover to lightly press the sensor against the amp surface when the cover was in place. Then I contact cemented the foot onto the clam-shell. (I set the rubber foot on the switch with contact cement-coated surface up - then installed the cover. After waiting a few moments, I removed the cover and Voila!... It was attached to the clamshell). I don't know that I improved matters greatly, but am a firm believer that heat transfer by conduction beats the heck out of transfer by convection and radiation in this case.

Take a look at SGC SG-239. http://sgcworld.com/products/239/239.html
No interface cable needed, only 12v and 1.5 watts RF. I like mine and it will tune just about everything in a couple of seconds. I use it portable and I will be getting another at Dayton for mobile apps. I'm hoping for a show special. I paid $169 for mine from SGC but they are regulary $249. I don't have any affiliation with SGC, they just make some really good tuners.

Mike,
Don't waste your time and energy miving the vertical to the roof. You would do so much better by adding some ground radials to your existing installation. Even if you have a small lot and can only put out radials 20 or 30 feet long and can put say 20 to 50 of them you will see a super performance increase and you will not need the tuner. Radials are easy to install. Use any copper wire, insulated, bare, #10, #18, it doesn't matter. As you run the wire away from the antenna use 20D galvanized nails every 2 or 3 feet and wrap the wire one turn around the nail and pushit into the ground. If you are using heavy wire then you can use landscape staples (any garden or hdwr store.) They are just a wire "U". once the wires are laid out and down you will be able to run the lawn mower over them with no problem. In a few months the grass will absorb the wire and the XYL won't even know they are there.

A vertical is a high angle radiator and best when ground mounted. If you do raise it, 10 to15 ft is high enough and you will only need 4 radials **per band**. That's 24 in your case and they must be resonant. (not good XYL appeal) On the ground, however, they need not be resonant but longer is better. Uniform lenght is better than long and short ones. When you reach the property line or house you can just bend them and follow the obstacle. The idea here is you are creating a return path for your RF. RF ground is different than electrical ground. The latter requires deep ground rods, RF requires long surface area.

I have used verticals for many years in defferent sittuations and they play well provided you have a good RF ground system. I had full size 80m vertical until a storm took out a tree the took ot the antenna. I am using a Butterut HF6V in the same location using the 38 radials (x 50 ft.) from the previous antenna.

Topic: 13887  Message: 13892

I have a Hustler 4BTV mounted on the ground and using radials. If you put tuned radials in the ground they will detune when you transmit. So, my suggestion would be to put out radial (bury them) at least 33' long. I started with 8 radials 33' in length and then cut them down to tunrd radials. I didn't notice any improvement in performance or deterioration. If you mount it on your roof you will need to install tuned radials. I have a friend who lives about a block from me and he has his mounted on the roof. He uses 4 radial per band. They are spread out like spokes on a wheel, as they should be. Roof mounting is the ideal way to go if you can do it. Second choice is ground mount with radials and lastly, ground mount with no radials. If you add radial to what you now have you will probably notice a big improvement in the performance of the 6 BTV. Any length will do, just make them as long as you can and spread them out. Bury them just below the surface.

Subject: [FT100] 6-BTV

Is anyone reading this using a Hustler 6-BTV antenna? Currently I have mine mounted on a ground pipe (driven into the soil exactly per instruction. No radials, I am using an MFJ-949E Tuner. I am seriously considering mounting the antenna to a chimney mount on the peak of the roof, between 15 and 20 feet higher than it is currently. I know I will have to add radials, all of which is worth it if I am going to gain any perceptible performance by making the effirt, And an effort it is.

Is there anyone reading this who has experience in moving a well-performing antenna to a new,supposedly superior configuration? Is it worth the effort?

Additional comments:

Mike, I forgot that you had that high tech stuff. Heck, just tape them to the ground. Hi Hi. (couldn't resist).

Norm, W3IZ, echoed pretty much what I said. Also, I spoke to NewTronics and their Engineers told me NOT to drive a ground rod into the ground next to the antenna. But, he did recommend using a length of PVC and wrap the coax around it at both the antenna and at the rig. I did that. I found a couple of pieces od PVC, 4" in dia. I wound 12 turns of mini8 coax around one of them at the base of the antenna. And I did the same thing after I bought the coax into the house. That one just lays on the floor. It will prevent the coax shield from acting as a radial and radiating a signal. If you can't find 4" stuff (12 turns at each end), then get 6" stuff and do 10 turns at each end. Well worth the effort, Mike. Line Norm said, I doubt you will see a tremendous amount of improvement by going to the roof, and the xyl appeal is much less than on the ground.

Hope the comments help. Let us know what you decide to do.

I did the two coils when I put the antenna up. I wrapped them around a very high tech core - empty chlorox containers. WHen you cut 'em down, they are perfect.

Thanks for the great articles, Paul. This is going to be interesting.

I did a little probing with a homebrew sniffer coil and learned that most of the noise is coming from the ignition wires and coils. The Tundra engine uses an unusual system of an electronic distributor and eight individual coils each mounted directly to a spark plug. There are no spark plug wires, but the primary wires going to the coils are radiating.

The wires are all bunched together into one big harness for all the motor sensors, etc.. Maybe I can separate the ignition wires from the harness and shield them. I'm wondering if aluminum heater tape(duct tape) would work for shielding of the wires.

Does anyone know if a special tool is needed to remove the ribbon connectors?

I need a little precision guidance on removal of same.

I wish it were unusual. Most Fords are like this too.

Yes, it is being radiated. No, it can't be eliminated by grounding your rig.

Some serious anger towards the factory is necessary.

D. Adams; what I've found works fairly well on Toyotas is really good grounding.
The rig has to have a big strap of ground braid (RF ground) from the chassis to the Toy body.I also used a power filter

http://www.powerwerx.com/dcfilters.html

to help on DC input side. I wouldn't use duck tape; not a good RF suppression material and its a mess to remove. There is some RF tape (even braid) that's available, altho I'm not sure where to buy it.

Pres,

I have a 2002 Explorer. Obvious iginition noise problem. Anger toward Ford is a good idea, but is there anything a bit more immediate and practical that you can suggest? (either technical or with respect to getting Ford to do something about it.

By the way, I grew up just a hop, skip and jump from Patchogue, in Levittown. I was WA2POC. My dad (83 years old) still lives in Levittown. He is W2QOA (an original call, not vanity). You native to the area?

Hi Graeme,

<<That discussion has been occurring on the FT-1000MP
mailing list>>

Yes it is but the measurements I'm looking for were posted here on the FT100 list in relation to ground the rig, and
the antenna, and the car body to the frame of a car. I was hoping to find them so that I could post them on the
FT1000MP list.

Well, I believe I have exhausted all technical shots at this insidious problem. It's not just Ford, but GM and we just heard Toyota has the same scheme.

They radiate RF. I cannot think of any way to stop it. It's like saying to the AM broadcast station: "can you stop radiating"?

No, actually, Ford's not SUPPOSED to be radiating.

Get an audience with your factory rep. Scream and show them it goes above 30MHz since they seem to absolve themselves of responsibility below there.

Howdy Dave.....The Stu Downs QEX article uses the same means of shielding an auto ignition system that is used on aircraft engines. If you have ever seen an aircraft engine, I am sure you noticed that most of the wiring is shielded and grounded. Works in aircraft and autos both, but what a pain. I was lucky in being able to negate the majority of my conducted RFI the -70db L-C filters. Please be sure and follow good procedures in identifying all sources of RFI. I found mine was in layers. I would guess that you have more conducted noise than you think. When I would solve one problem, it would expose another. My "ABS" system was very noisy until I appled "Palomar Magic". The ARRL RFI book is invaluable and one has to be persistent.

I have not had to shield my ignition system yet, but may one day. I probably have one "S" unit of RFI (depending on the band) to deal with now and consider this acceptable. I thought about using aluminum tape too, but it does not last very long, so I am told....73's, Paul KD5KCZ
